

Ecological forecasting to anticipate ecological responses to environmental stressors

R. Quinn Thomas

Associate Professor

College of Natural Resources and Environment

29 July 2021

National Academies of Sciences, Engineering
and Medicine

Expertise

- Principal Investigator of NSF-funded Ecological Forecasting Initiative Research Coordination Network
- Develop nationally used training modules in ecological forecasting
- Research on forest demographic responses to nitrogen and sulfur deposition is informing the “Integrated Science Assessment for Oxides of Nitrogen, Oxides of Sulfur and Particulate Matter - Ecological Criteria” by the U.S. Environmental Protection Agency (EPA).

Decisions are being made in the context of a rapidly changing environment

— Decision-makers —

Uninformed decisions

● Decisions

Informed decisions

EPA works to **ensure** that:

- Americans have clean air, land and water;
- National efforts to reduce environmental risks are based on the **best available scientific information**;

Involves developing forecasts

EPA works to **ensure** that:

- Americans have clean air, land and water;
- National efforts to reduce environmental risks are based on the **best available scientific information**;

Predicting nature like we predict weather

The ecological sciences are undergoing a transformation similar to meteorology and weather forecasting

Weather forecast model

Timestep 5–10 minutes
Grid spacing 10–20 km

Data-model fusion (aka: data assimilation)

Updated weather model

Timestep 5–10 minutes
Grid spacing 10–20 km

Extended Forecast for Charlottesville VA

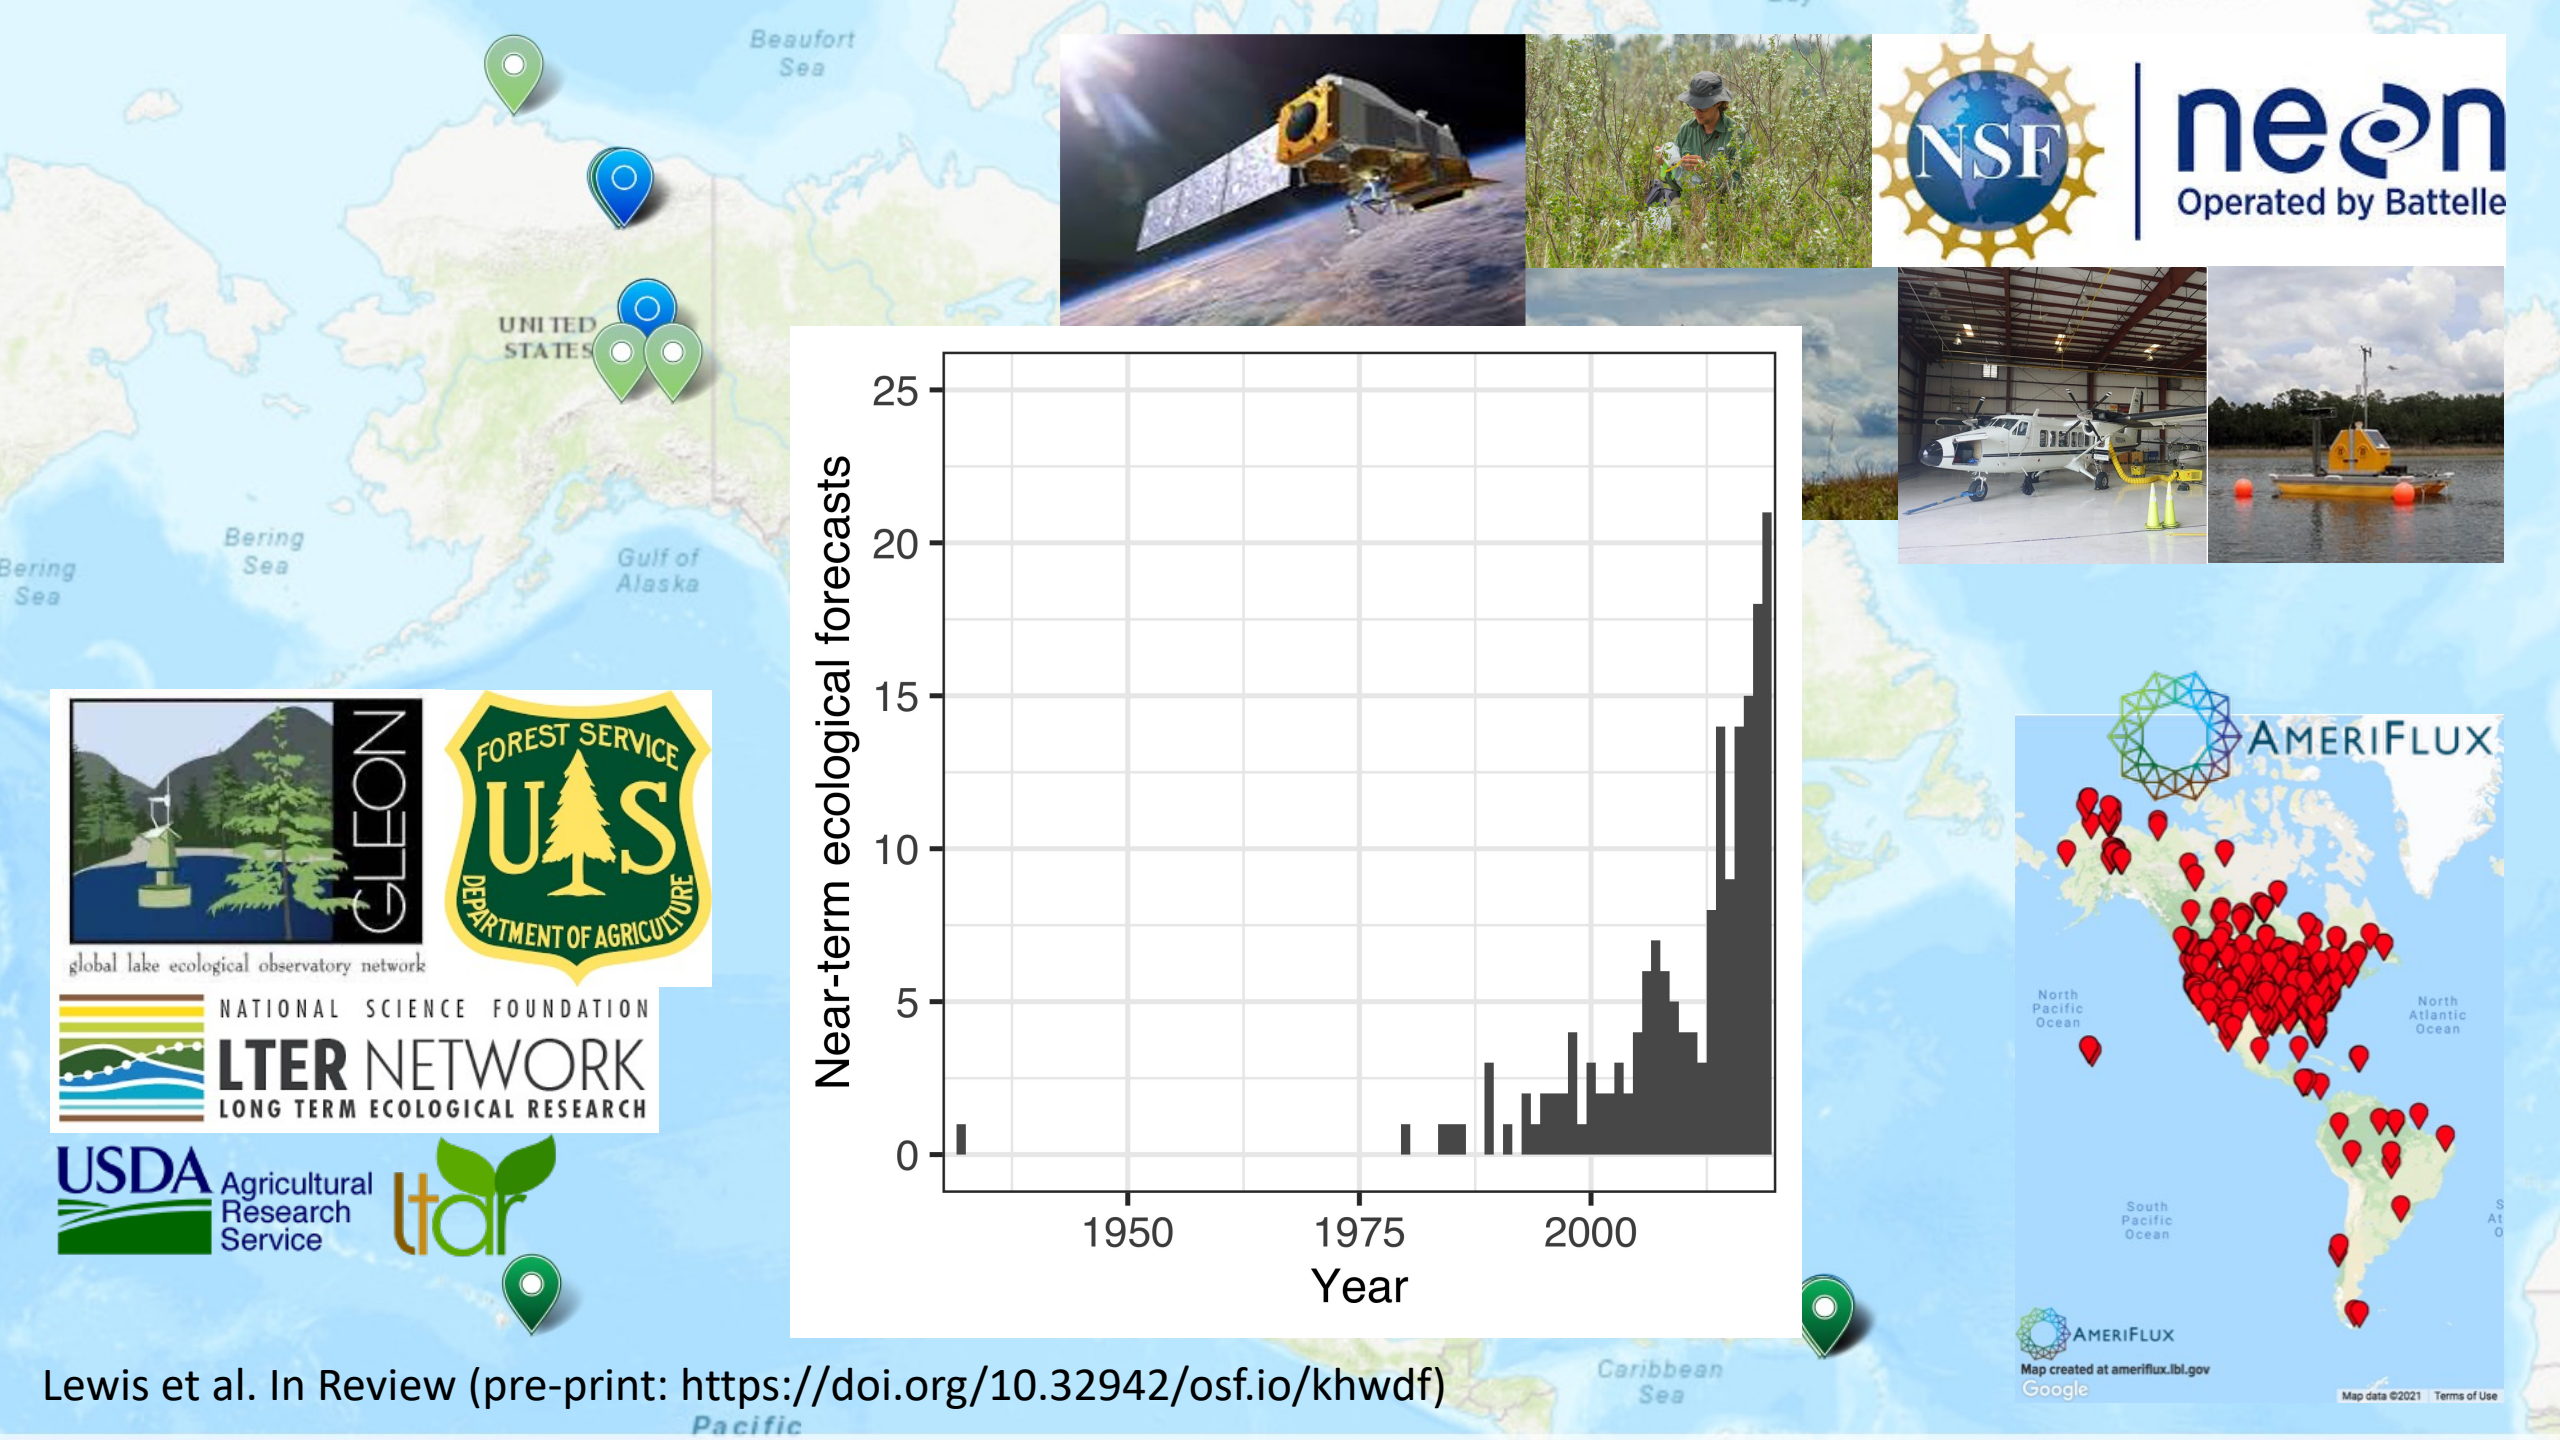

Decision support

global lake ecological observatory network

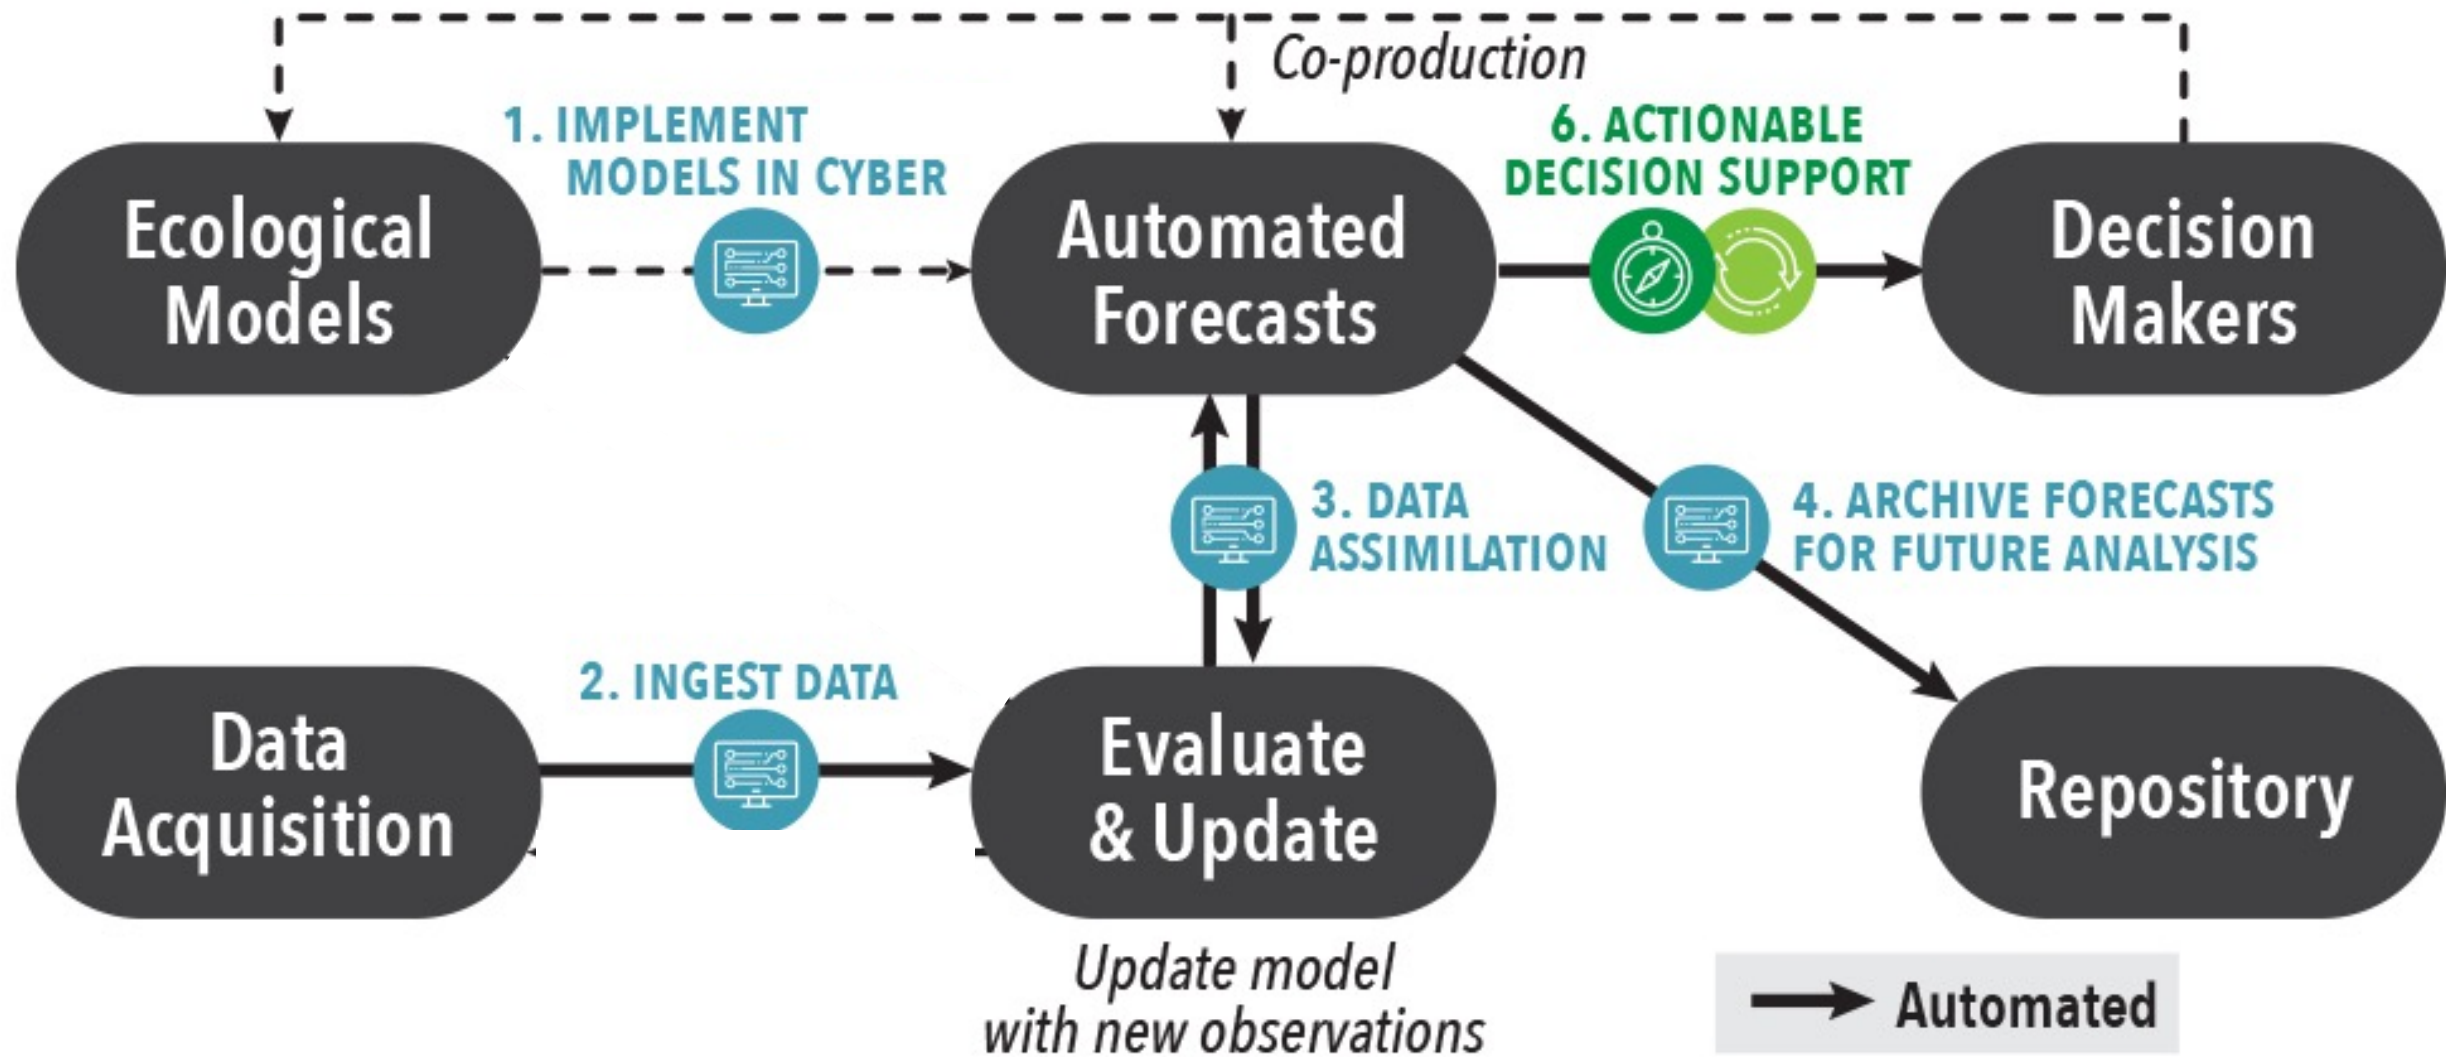

Lewis et al. In Review (pre-print: <https://doi.org/10.32942/osf.io/khwdf>)

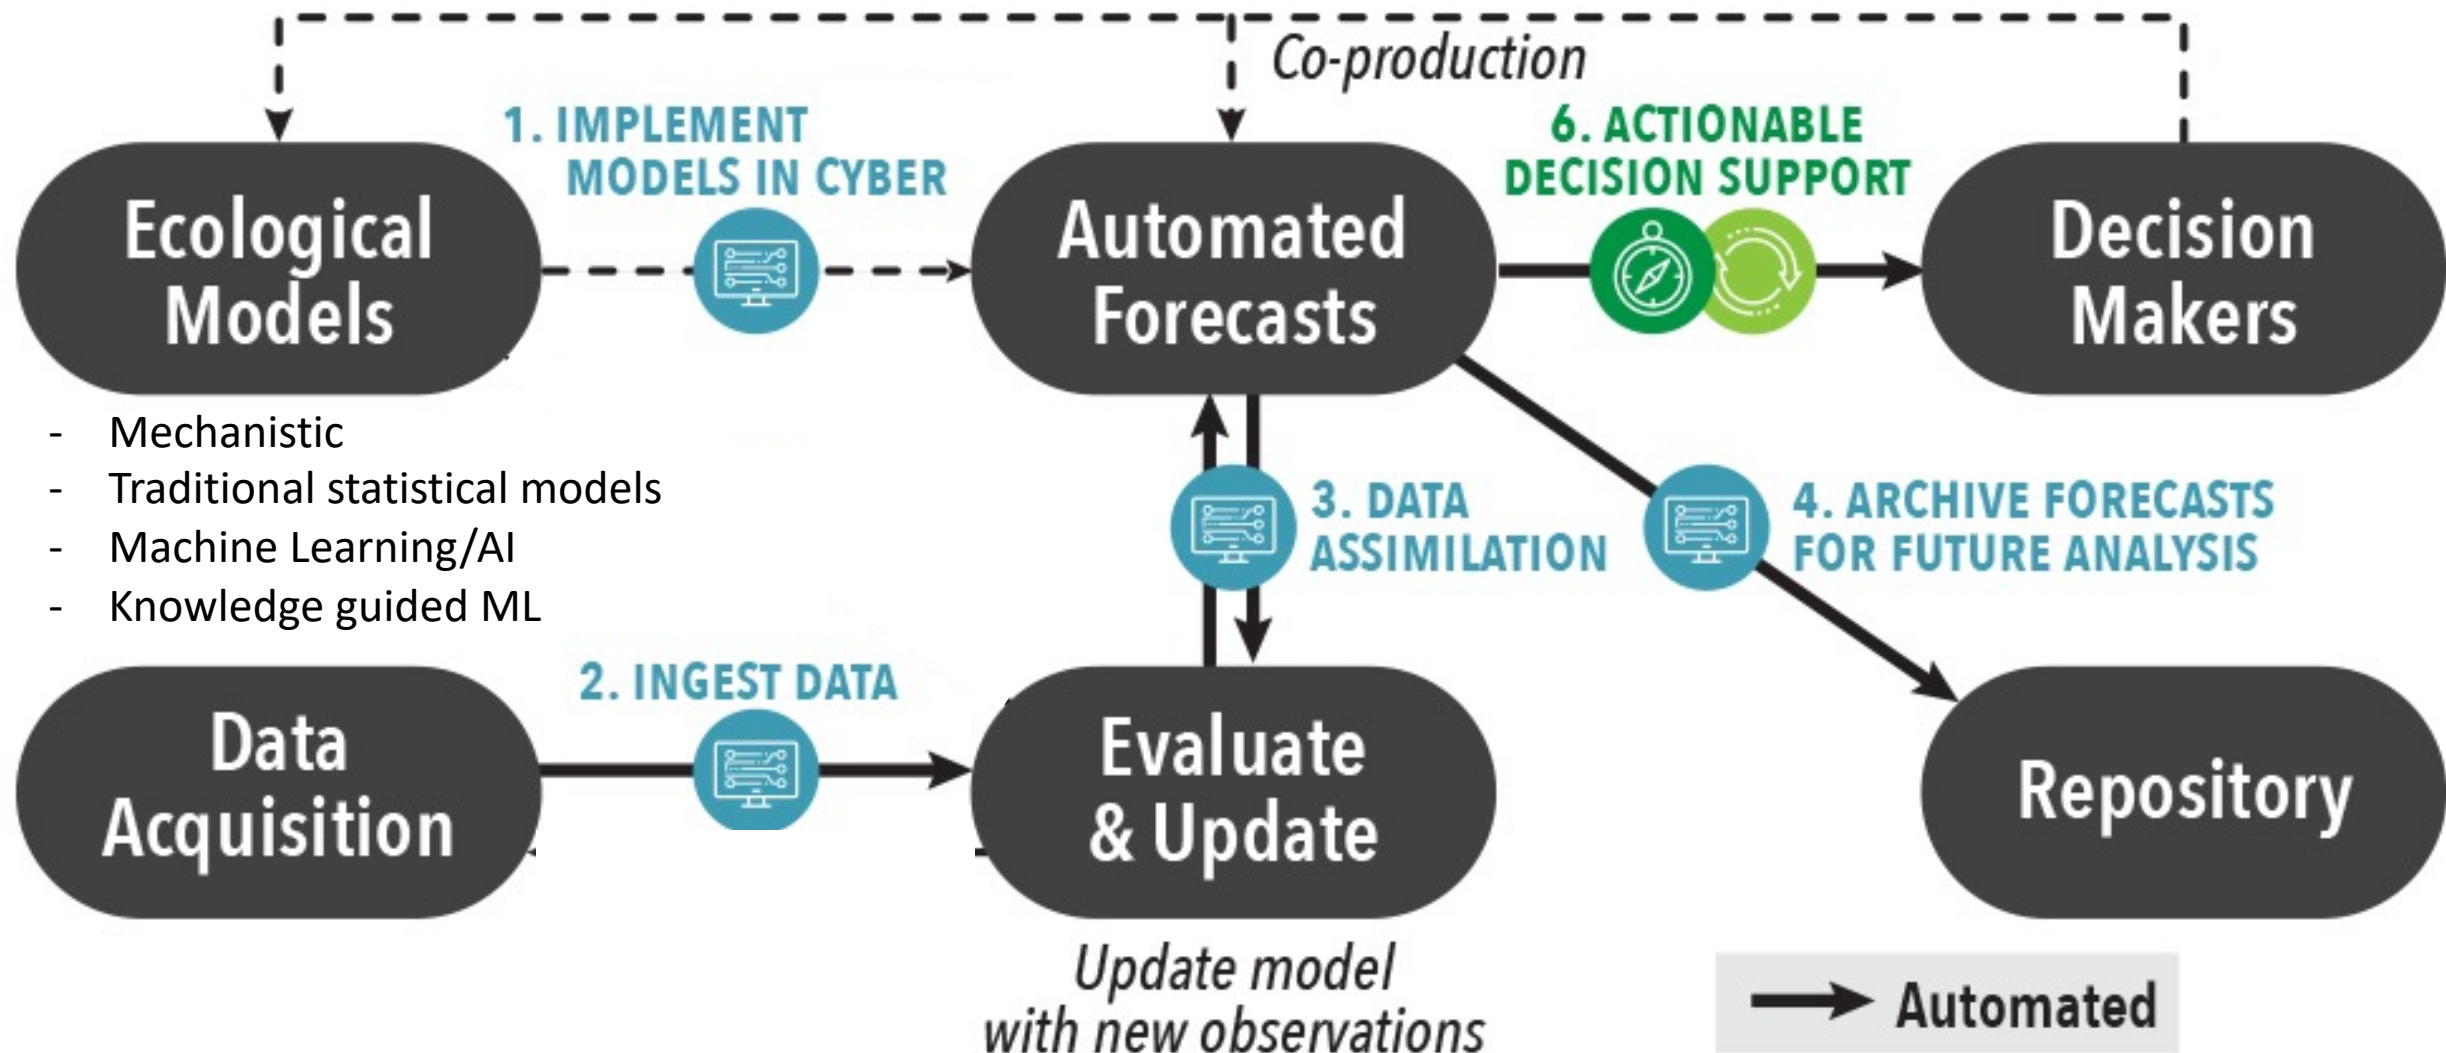

Near-term iterative forecasting helps anticipate ecological responses to environmental stressors

- **Forecast:** a probabilistic prediction of the future
- **Iterative:** repeated forecasts that can be evaluated with data so to gain knowledge from the evaluation and update forecast models
- **Near-term:** forecasts at a time-scale that allows for evaluation - ranges from daily to decadal

Looking forward

- EPA collaborates with and fund federal, state, and university forecasting efforts to collectively elevate the quantity, quality, and utility of ecological forecasts
 - USGS, NASA, NOAA and others have emerging ecological forecasting thrusts
- EPA increases the integration of near-term iterative ecological forecasting into decision support

Ecological Forecasting—21st Century Science for 21st Century Management

Table 3. Promising potential ecological forecasting products identified at the workshop.

Topic	Management need	Forecast description	Partners and collaborators	Stakeholders
Freshwater cyanobacterial blooms	High temporal resolution forecasts of toxin exposure can improve management of drinking water, agricultural irrigation, livestock, fish and wildlife populations	Daily forecasts of cyanobacterial blooms for inland freshwater lakes (near term); daily toxin and health effects forecasts	EPA, NASA, and NOAA	States, Tribal Nations, drinking water utilities, and BLM, BOR, NPS, FWS, and USACE
Coastal marsh erosion	Forecasting vegetation and habitat change resulting from sea-level rise and storm surge can inform siting of living shorelines and anticipate impacts to wildfowl populations	Short-term forecasts of coastal ecosystem vulnerability (resilience) potential	NOAA, EPA, coastal communities, FWS refuges, NPS, EPA, State agencies, NGOs, coastal commercial operations	Governments and residents of coastal zones

Bradford, J.B. et al. 2020, Ecological forecasting— 21st century science for 21st century management: U.S. Geological Survey Open-File Report 2020–1073, 54 p., <https://doi.org/10.3133/ofr20201073>.

Looking forward

- EPA increases the use of iterative analyses that automatically update as more data become available

Increased tree carbon storage in response to nitrogen deposition in the US

Millions of remeasured trees by US Forest Service
Changes in atmospheric deposition

PLOS ONE | <https://doi.org/10.1371/journal.pone.0205296> | October 18, 2018

RESEARCH ARTICLE

Growth and survival relationships of 71 tree species with nitrogen and sulfur deposition across the conterminous U.S.

Kevin J. Horn¹, R. Quinn Thomas^{1*}, Christopher M. Clark², Linda H. Pardo³, Mark E. Fenn⁴, Gregory B. Lawrence⁵, Steven S. Perakis⁶, Erica A. H. Smithwick⁷, Douglas Baldwin⁷, Sabine Braun⁸, Annika Nordin⁹, Charles H. Perry¹⁰, Jennifer N. Phelan¹¹, Paul G. Schaberg³, Samuel B. St. Clair¹², Richard Warby¹³, Shaun Watmough¹⁴

Millions of remeasured trees by US Forest Service
Changes in atmospheric deposition

How has the sensitivity to nitrogen and sulfur deposition changed?

Looking forward

- Capacity building in ecological forecasting
 - Support for university training, post-doctoral programs, in-house staff with expertise

Near-term iterative forecasting is a win-win
