Most of the previous century could be called a “century of undersampling.”

Walter Munk

Testimony to The U.S. Commission On Ocean Policy, 18 April
2002

By the end of this decade we need to have a sustained, integrative and inclusive way of observing the ocean through intelligent robotic sampling and intelligent modeling

The Sampling Conundrum

1. Finite Time
2. Finite Energy
3. Finite Sampling Resources
4. Uncertainty of occurrence of phenomenon
5. Uncertainty of location, size, shape and strength of feature signal

research: understanding the nature of autonomy

Remote Agent Experiment (DS1)

- Flew onboard Deep Space 1, May 17-21, 1999
- 65 Million miles from Earth, during *Ballistic Cruise*
- One of six principals
- NASA's 1999 Software of the Year

New Millennium Deep Space One (DS1)

MAPGEN: Mixed-Initiative Activity Planning

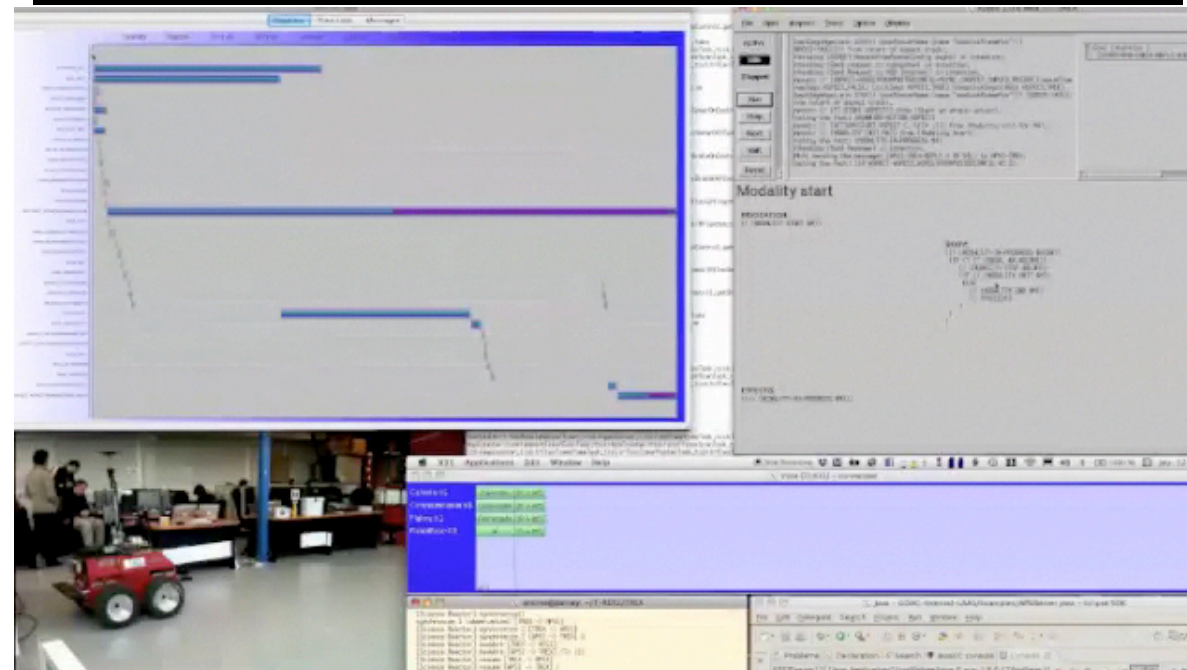

onboard plan synthesis and execution

- Functional scope along the lines of *what*
- Temporal scope along the lines of *when*

METEOR: A Mobile (portable) ocean robotic ObservatORy

Vision

Vision: Coordinated Observations from fine scale to meso scale

- The ocean doesn't have straight lines; so why are we sampling along those?
 - Robotic adaptation and statistical methods with control is critical
 - Robotic (and sensing) methods have improved — yet we're still in the 'Charles Darwin' approach to sampling
- Exploration across space and time is more effective with robotics coupled with decision-making (embedded or not)
- Increasing investment in marine robotics to provide new tools and methods to observe should occur at less sclerotic pace
- NSF should/can provide added incentives for Computer Scientists to go “smell” the ocean
- More isn't necessarily better; smarter is — decision-theoretic methods can help
- AI is not ML — there's more to AI than just “data” and “analytics”
