

# Decadal Survey of Ocean Sciences 2025-2035: Coral reef changes in the next 100 years

Dr. Sarah W. Davies  
Assistant Professor  
Department of Biology  
February 16<sup>th</sup>, 2024

**BOSTON  
UNIVERSITY**

“Coral Holobiont”

Interactions between these holobiont members are the building blocks of entire reef ecosystems

# CORAL REEF SERVICES

Knowlton *et al.* 2021

Global economic value: US\$10 trillion/year<sup>1</sup>

Socio-cultural benefits<sup>2</sup>:

13% of humans live within 100km of reefs  
94% of small island nation populations

Health Reef Ecosystems = Healthy People

Future socioeconomic viability of  
coral reefs uncertain

# Coral Bleaching

P. Marshall

Mark Priest

# Coral Disease

Valerie Paul

# CORAL REEF THREATS

greenhouse  
gas emissions

change in  
land use

pollution

invasive  
species

direct  
exploitation

Knowlton *et al.* 2021

Annual divergence of global ocean temperature  
from 20th century average (1880-2020)

Ocean surface temperatures

Source: NOAA National Centers for Environmental Information (NCEI)

Coral reef cover is predicted to decline  
by up to 99% if global warming  
reaches 2°C above pre-industrial levels  
(IPCC 2018)

The coming year and decade likely offer the last chance for international, regional, national, and local entities to change the trajectory of coral reefs from heading towards world-wide collapse to heading towards slow but steady recovery.

August 2022

August 2023

# Why is predicting coral responses to climate change so challenging?

Unrecognized coral genetic diversity

Enormous algal genetic diversity

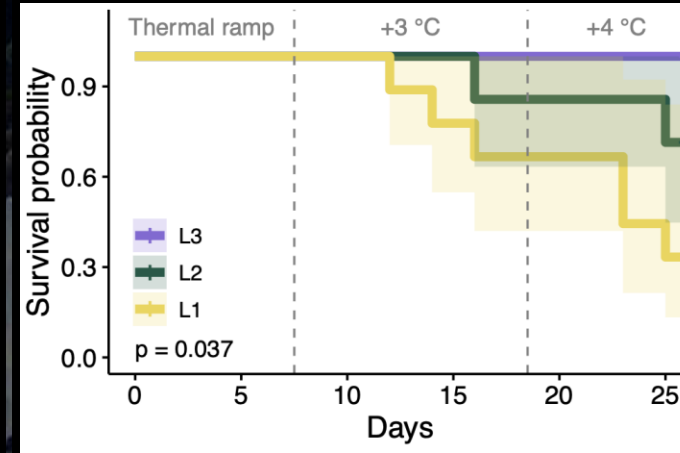

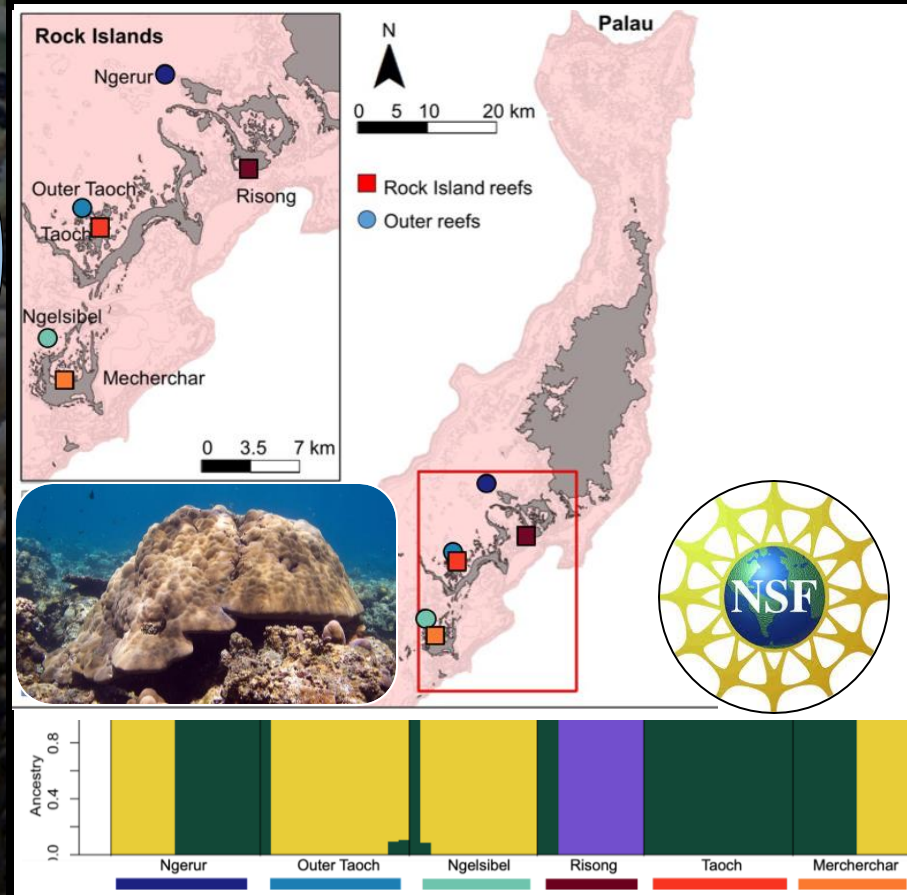

Holobiont Interactions

# Why do some corals win and others lose?

Unrecognized coral genetic diversity

Functional variation within a “species”

## nature ecology & evolution

Perspective

## Recommendations:

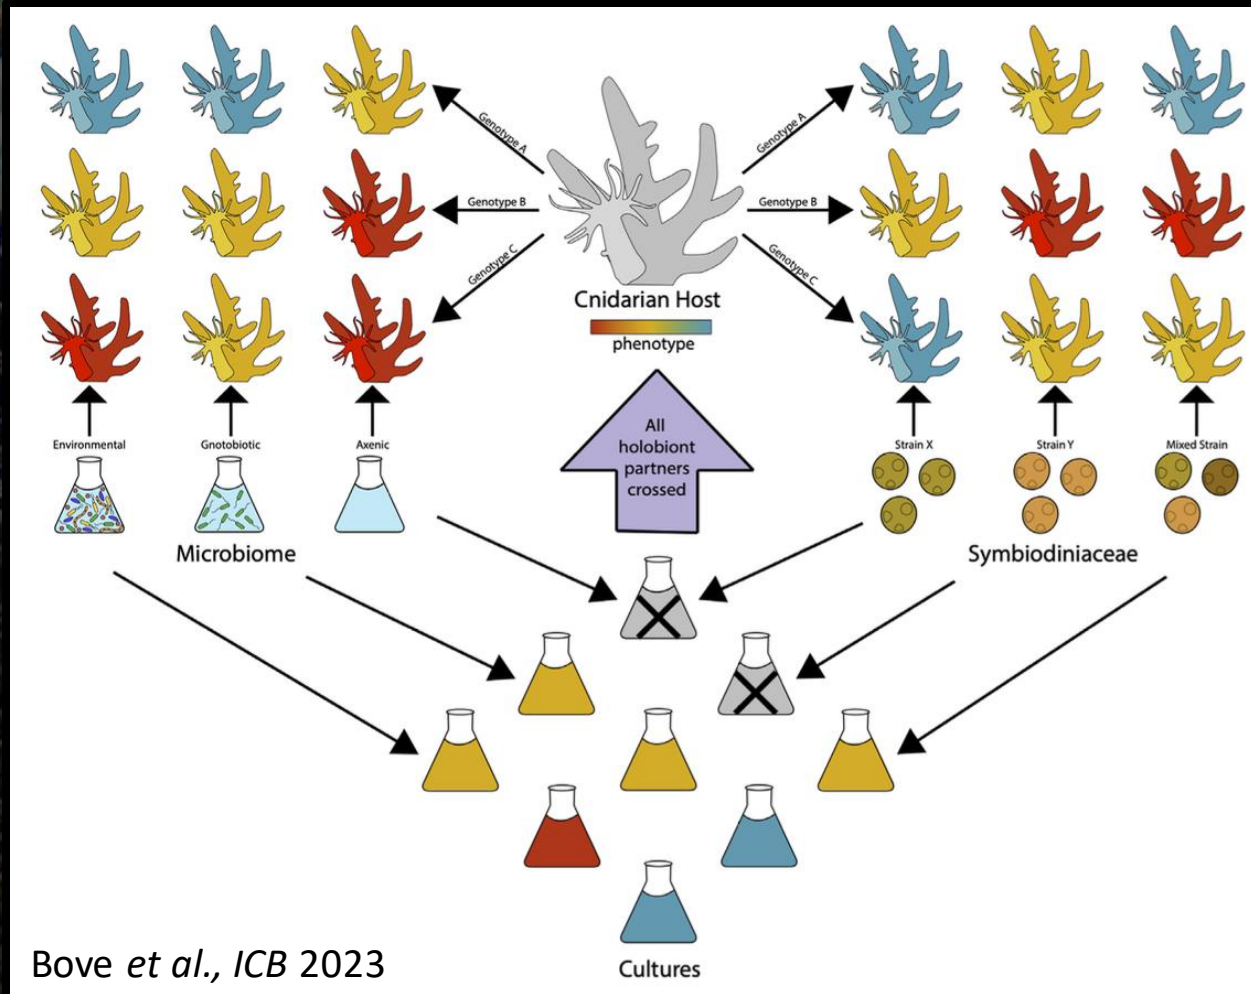

1. Technological advancements for assessing diversity
2. International collaborations to link diversity with function
3. Expand accessible culture collections and taxonomy

Davies *et al.*, PeerJ 2023

# Why do some corals win and others lose?

## Holobiont Interactions

Bove *et al.*, ICB 2023

Different host-symbiont-microbiome combinations might yield novel phenotypes under climate change

**Recommendation:** Research on mechanisms underlying how holobiont interactions are shaped by changing oceans

Efforts to mitigate warming and improve local conditions are paramount

Policy challenges: corals, currents and CO<sub>2</sub> emissions do not respect political boundaries

**Recommendation:** Urgent need for incentives and mechanisms for multinational collaborations

Broader engagement with multinational stakeholders will bolster science and conservation

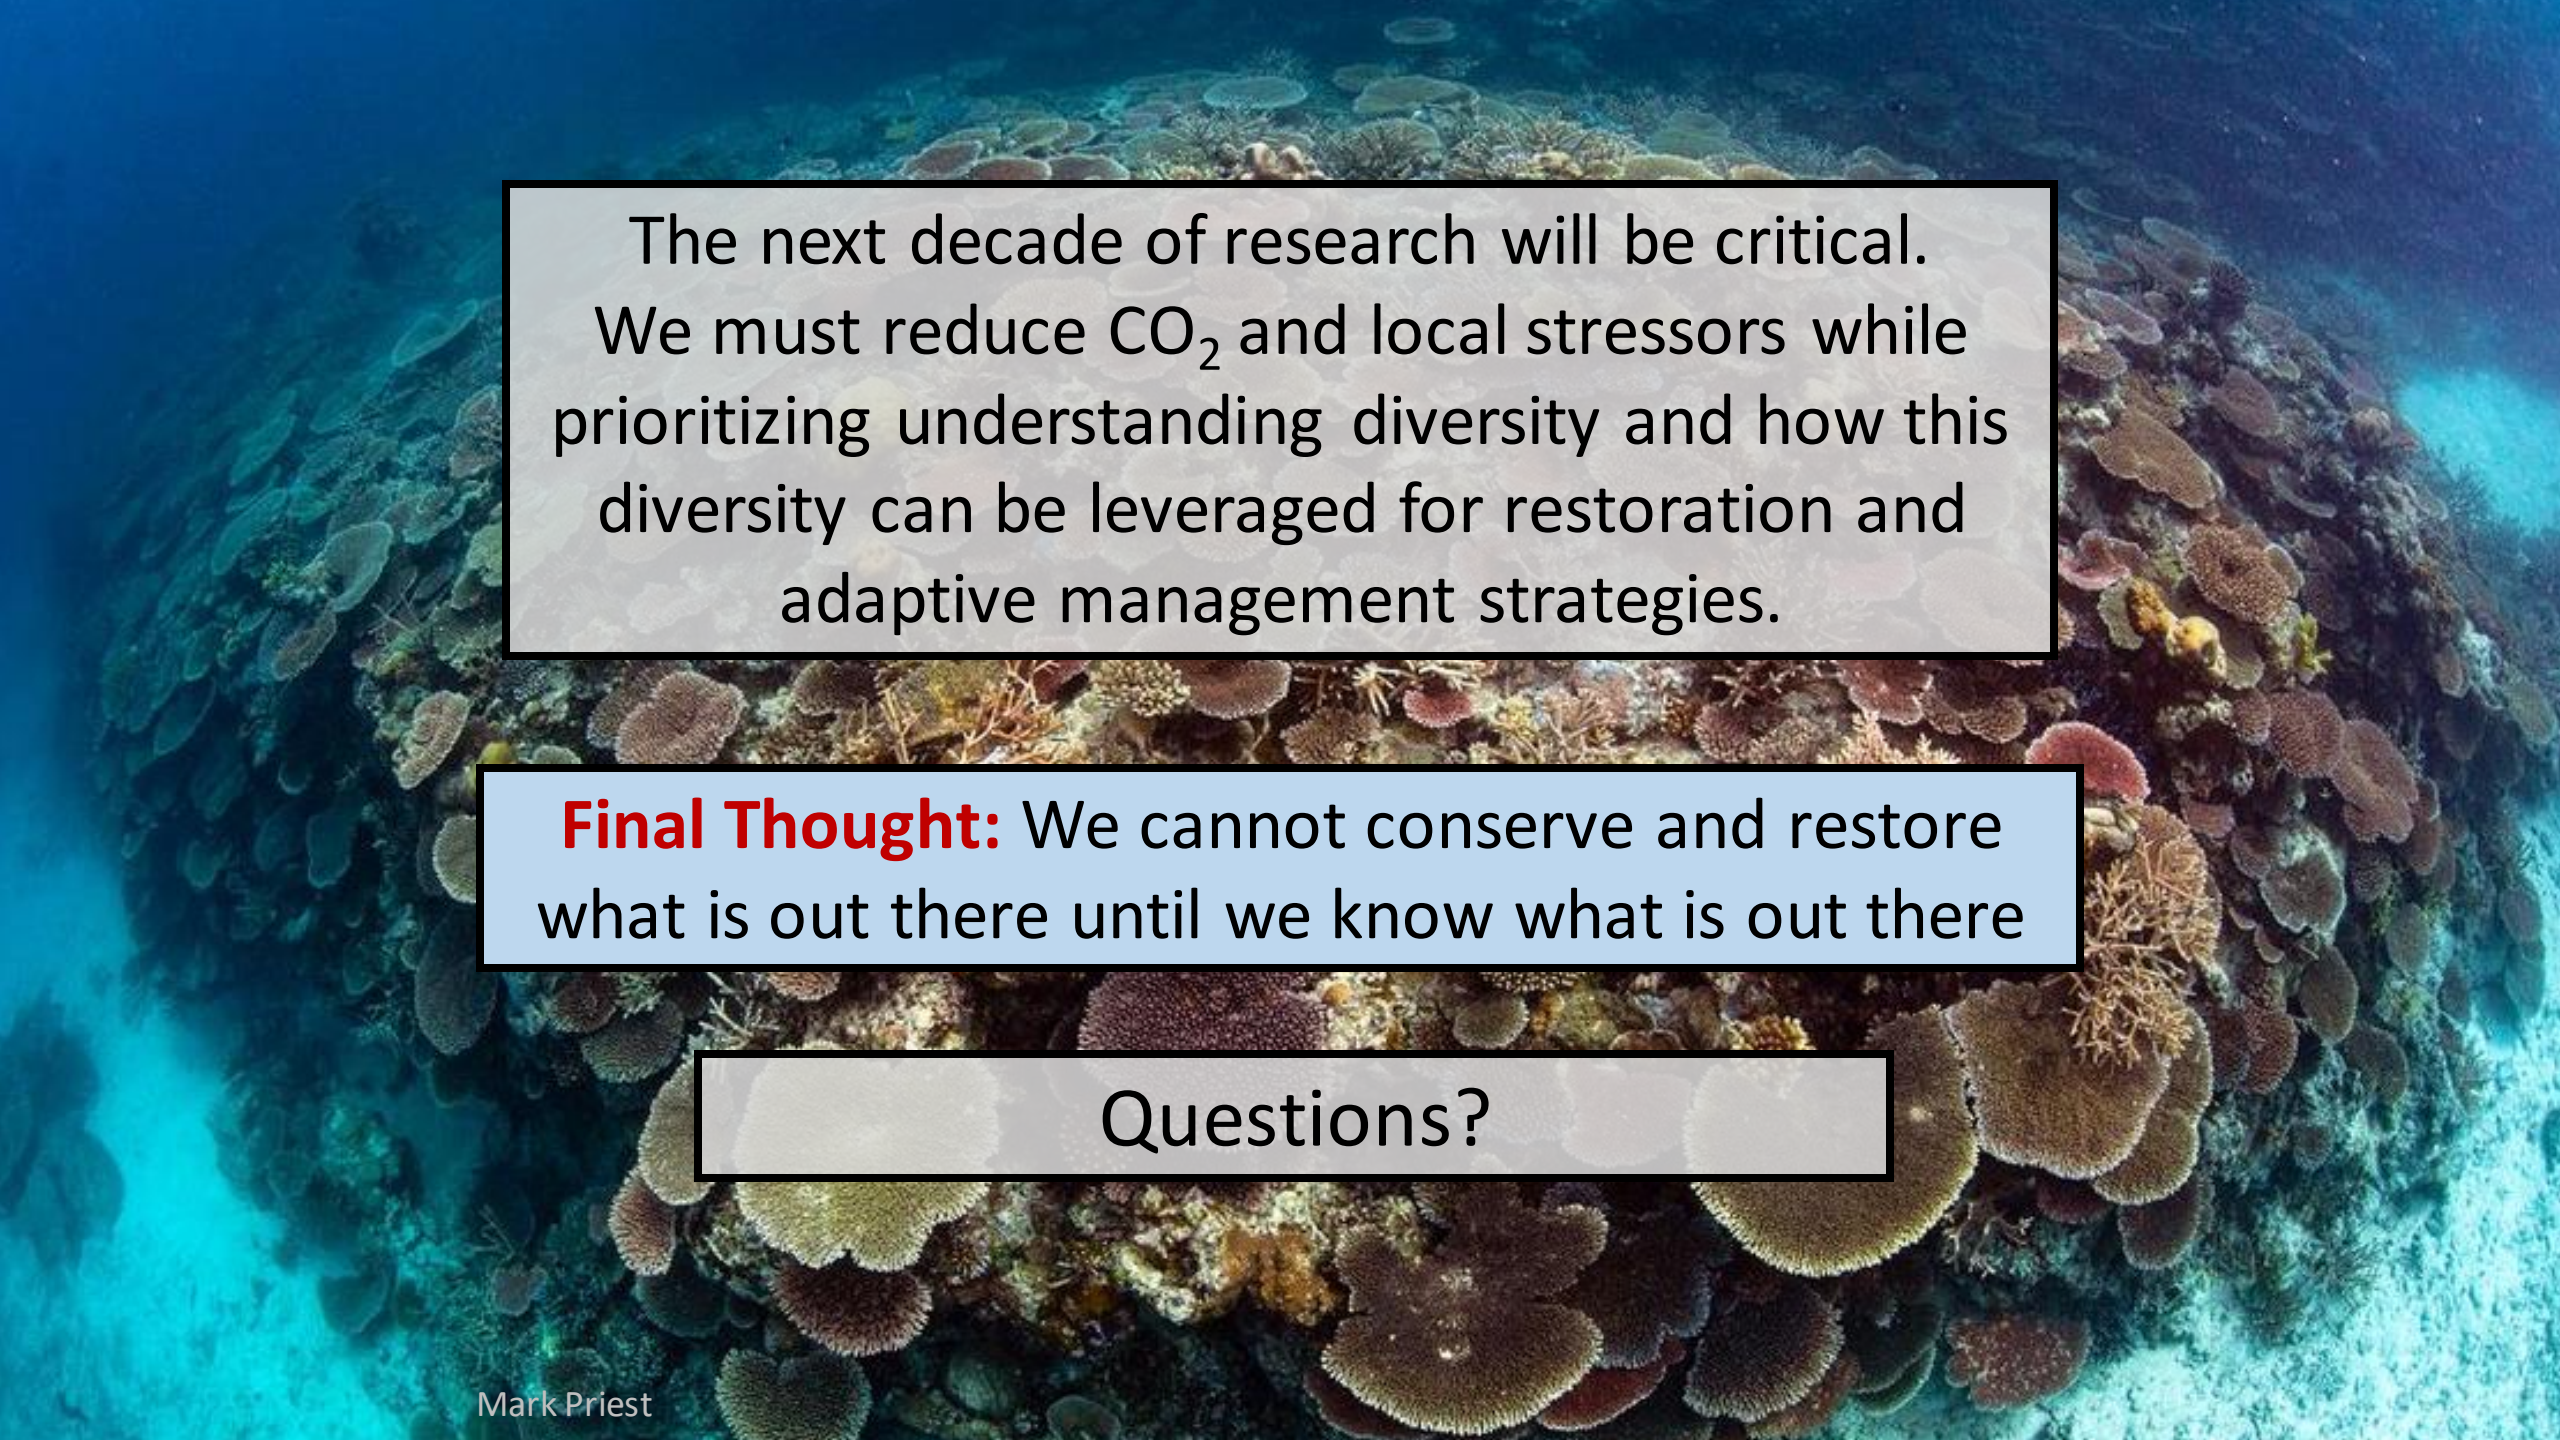

actively  
restore

## Recommendations:

1. National repositories or Biobanks to preserve host and symbiont genotypes
2. Efforts to create novel genetic combinations (i.e., hybrid vigor)
3. Research the potential risks associated with novel interventions
4. Investment in host and symbiont taxonomy: Policies are based on species

The next decade of research will be critical.  
We must reduce CO<sub>2</sub> and local stressors while  
prioritizing understanding diversity and how this  
diversity can be leveraged for restoration and  
adaptive management strategies.

**Final Thought:** We cannot conserve and restore  
what is out there until we know what is out there

Questions?
