Optimizing Health With Age: What is Nutrition's Role? Cognitive Decline

Robert B. Wallace, MD, MSc

Depts. of Epidemiology and Internal Medicine

University of Iowa

No conflicts of Interest to declare

Goals of this Talk

Define, characterize and provide:

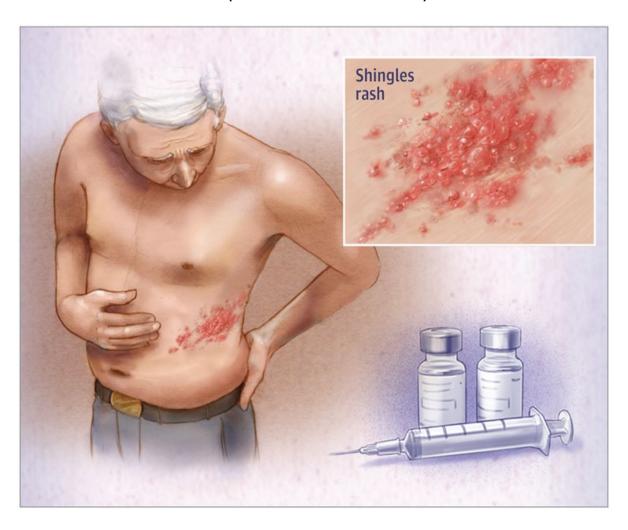

- -The preventive and public health context of food, nutrition and dementia
- -Overview of nutritional and some related associations with dementing illnesses
- -The social and clinical context of nutrition for dementia patients
- -The interface of aging and nutrition issues in older people
- -Some recent, intriguing research findings on nutrition and dementia

The Preventive and Public Health Context of Cognitive Decline—A Few Lifecourse Issues

- Many children approach adulthood with cognitive problems, including developmental disabilities
- Exposure to environmental and social issues that effect brain function often not available (e.g., environmental, occupational, traumatic)
- It is extremely difficulty to understand Alzheimer's disease and other 250+ dementias, and their clinical presentations
- US Preventive Services Task Force does not recommend screening elders for dementia
- Proposal: Lifelong brain health prevention programs, including diet.

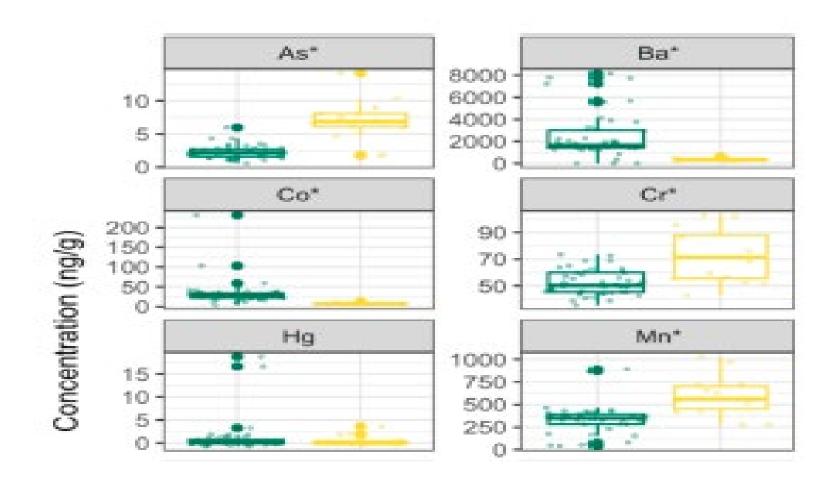

Shingles and Other Vaccines Associated with Dementia Protection (JAMA Oct. 18, 2024)

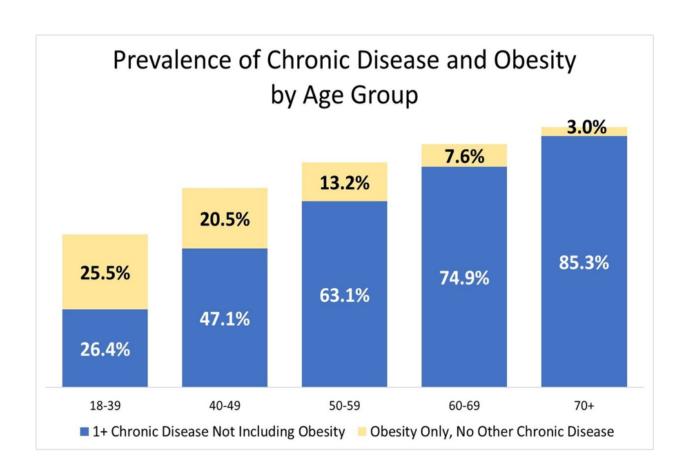

Environmental Sources of Cognitive Impairment Metals in Tampons; Air Pollution

(Env. Intl 2024, 190:108849)

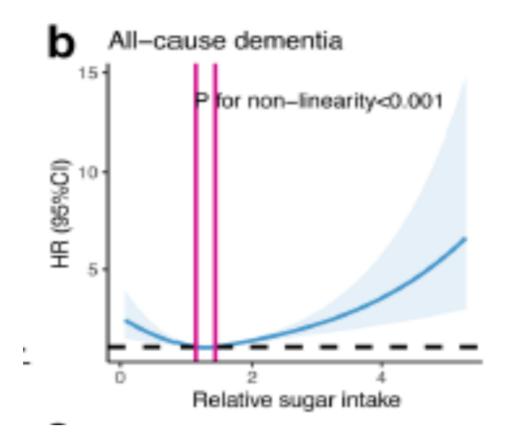

Prevalence of One or More Chronic Illnesses Across the Lifespan

Sugar Intake and All-Cause Dementia Rates in the UK Biobank Cohort Study: Women and Men

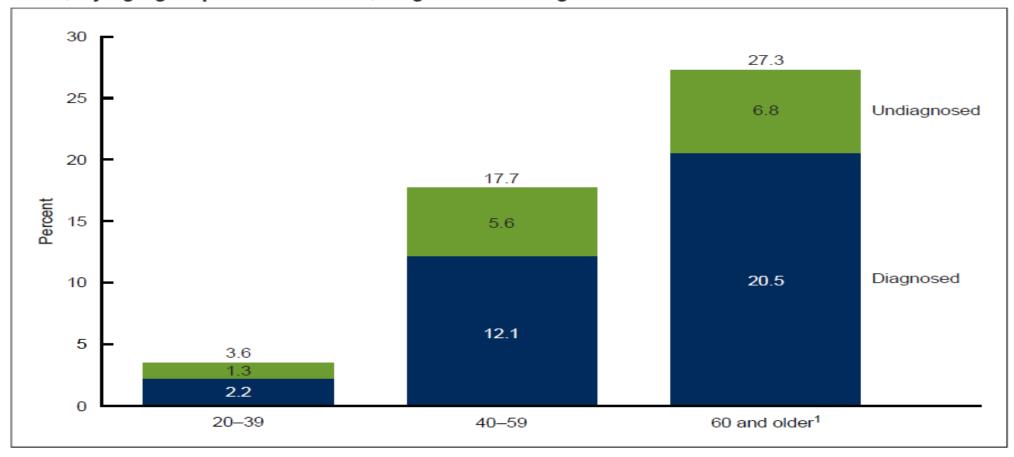

(BMC Medicine 2024,22:298)

Prevalence of Diabetes in the US

(NCHS Data Brief No. 516, Nov. 2024)

Figure 2. Prevalence of total, diagnosed, and undiagnosed diabetes in adults age 20 and older, by age group: United States, August 2021–August 2023

A Closer Look at Diet and Dementia

The Social and Clinical Context of Dementias

(Google Images)

- -Social Determinants of Health
- -Food: access (security-economics); safety
- -Family support; loneliness*
- -Elder mistreatment (head injury)
- -Mental illness and its treatments
- -Incarceration
- -Addiction
- -Homelessness

Association Between Food Insecurity and Probable Dementia (PSID Cohort) (J. Gerontol. Series B. Vol. 79 Publ. 7Sept24)

	<u>OR</u>	95%CI
Food Insecurity (self-rep.)	2.0	1.1-3.6
Food Insecurity (observer rep.)	2.0	1.1-3.5

Overview of Diet/Nutrition Interventions and Cognitive Decline

- Classical dementing illnesses—deficiencies in low folate, B6, B12 (e.g., pernicious anemia)
- Many hypotheses (e.g., low sodium; omega-3 fatty acids; iron accumulation in the brain (complex issue)
- Large literature on polyphenols (anti-oxidants), and related dietary supplements (e.g. genistein)
- Various diet patterns, tested to varying extent for long term cognitive change. Mediterranean Diet; DASH Diet; MIND Diet, etc.
- Time-interrupted (fasting) diets
- Diabetes/ obesity metabolism; "heart healthy" diets

The Clinical Challenges of Feeding Dementia Patients

(Google Images)

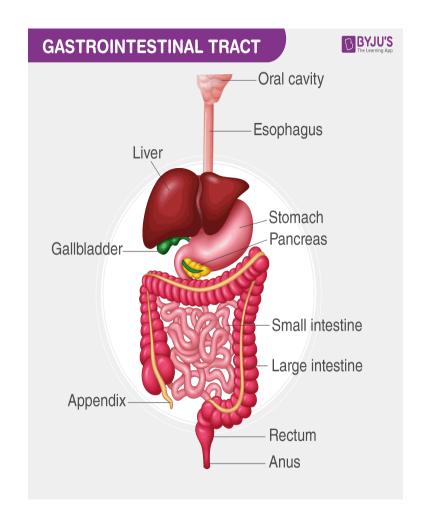

- -Patient lack of interest/ attention
- -Taste and smell deficits
- -Dentition (teeth and gums)
- -Swallowing difficulty; aspiration
- -Bodily symptoms hard to assess (e.g., food allergy; adverse safety effects)
- -Inability to express food preferences
- -Dietary decisions due to multi-morbidity and, sometimes costs
- -Malnutrition-an important problem

But... Not All Dementia-Related Food and Nutrition Problems are Due to Dementing Illnesses: **The GI Tract and Aging**

(Curr Opin Nutr Metab Care 2016, 19:12-18)

- GI Motility, including gastric emptying
- Changing GI hormone and enzyme production
- Absorption of food and nutrients, including water
- Intestinal food digestion
- Degeneration of GI neurological function
- Immune function; incl. microbiota

Glucagon-Like Peptide-1 Drugs: Effects on Motor and Dementia Tests

(Neuropharmacology 253 (2024) 109952)

Effect of Sugar Rationing *in Utero and* Infancy on Type 2 Diabetes Risk about 60 Years later

10.1126/science.adn5421 (2024)

Summary

- Nutrition and diet are very important for preventing dementia and managing dementia patients, as well as controlling other environmental exposures
- Brain health maintenance should be a higher public priority
- Co-morbid conditions and aging play important roles in all cognitive illnesses; all need medical attention
- Promote more heart health:
- "Heart health is brain health" -Pauline Maki
