Knowledge that will change your world

**UAB** CENTER FOR  
EXERCISE MEDICINE

*Moving Research into Medicine*

# Key terms defined

- **Physical activity:** Any bodily movement produced by skeletal muscles that results in energy expenditure' above resting (basal) levels. Physical activity broadly encompasses exercise, sports, and physical activities done as part of daily living, occupation, leisure, and active transportation.
- **Exercise:** Physical activity that is planned, structured, and repetitive and that has as a final or intermediate objective the improvement or maintenance of physical fitness.
- **Physical fitness:** The ability to carry out daily tasks with vigor and alertness, without undue fatigue and with ample energy to enjoy [leisure] pursuits and to meet unforeseen emergencies. Operationalized as a set of measurable health and skill-related attributes:
  - **cardiorespiratory fitness (VO<sub>2</sub>max)**
  - **muscular strength/endurance**
  - **body composition**
  - **flexibility**
  - **balance, agility, reaction time and power.**
- **Physical function:** The capacity of an individual to carry out the physical activities of daily living. Physical function reflects motor function and control, physical fitness, and habitual physical activity and is an independent predictor of functional independence, disability, morbidity, and mortality.
- **Energy expenditure:** The total amount of energy (gross) expended during exercise, including the resting energy expenditure (resting energy expenditure + exercise energy expenditure). Energy expenditure may be articulated in METs, kilocalories or kilojoules.
- **MET:** An index of energy expenditure. A MET is the ratio of the rate of energy expended during an activity to the rate of energy expended at rest. One MET is the rate of energy expenditure while sitting, and is equal to an oxygen uptake of 3.5 mL/kg/min.
- **Inactivity:** Sedentary behavior or activity that involves little or no movement or physical activity, having an energy expenditure of about 1–1.5 METs. Examples are sitting, watching television, playing video games, and using a computer.

# Factors influencing exercise adaptation: key research priorities

# Primary modes of exercise, and current HHS guidelines for the general population

## Endurance (aerobic) training

### HHS Guidelines (2008 PAGC)

**150 min/wk moderate intensity  
(via exercise on most days)**

**OR**

**75 min/wk vigorous intensity  
(across ~3 days/wk)**

## Resistance (strength) training

### HHS Guidelines (2008 PAGC)

**Strengthening exercise for each  
major muscle group  
2 days/wk**

| Endurance Training (e.g. 70% HRR) |                     |
|-----------------------------------|---------------------|
| Cardiorespiratory                 |                     |
| VO2max                            | ↑↑                  |
| Cardiac muscle                    | Preload hypertrophy |
| Resting HR                        | ↓↓                  |
| Resting SV                        | ↑                   |
| Resting SBP                       | ↓ in hypertensives  |
| Resting DBP                       | ↓ in hypertensives  |
| Skeletal Muscle                   |                     |
| Type I myofiber hypertrophy       | ↔                   |
| Type II myofiber hypertrophy      | ↔                   |
| Type IIx to IIa myofiber shift    | ↑↑                  |
| Capillary density                 | ↑↑                  |
| Mitochondrial content             | ↑↑                  |
| Anaerobic enzymes                 | ↑                   |
| Oxidative enzymes                 | ↑↑                  |
| PC stores                         | ↔ or slight ↑       |
| Glycogen stores                   | ↑                   |
| Intramyocellular lipid stores     | ↑                   |

| Resistance Training (e.g. 75% 1RM) |                       |
|------------------------------------|-----------------------|
| Cardiorespiratory                  |                       |
| VO2max                             | ↔ or slight ↑         |
| Cardiac muscle                     | Afterload hypertrophy |
| Resting HR                         | ↓                     |
| Resting SV                         | ↑                     |
| Resting SBP                        | ↔ or slight ↓ in HTN  |
| Resting DBP                        | ↔ or slight ↓ in HTN  |
| Skeletal Muscle                    |                       |
| Type I myofiber hypertrophy        | ↑                     |
| Type II myofiber hypertrophy       | ↑↑                    |
| Type IIx to IIa myofiber shift     | ↑↑                    |
| Capillary density                  | ↔                     |
| Mitochondrial content              | ↔                     |

| <b>Metabolic</b>                     |          |                                 |
| Insulin sensitivity                  | ↑↑       | ↑                               |
| HDL cholesterol                      | ↑↑       | ↑↑                              |
| LDL cholesterol                      | slight ↓ | ↔ or slight ↓                   |
| Triglycerides                        | ↓        | ↓                               |

# Cardiorespiratory fitness defined

- CRF = aerobic capacity, or maximum rate of oxygen consumption/utilization (i.e.  $\text{VO}_{2\text{max}}$ )
- Hallmark measure of fitness
- Major predictor of health and mortality
- Assessed via maximal exercise test protocol (typical 30 min)
- Total test time
- Highly responsive to training and deconditioning

# Reduced Disability and Mortality Among Aging Runners

*Arch Intern Med.* 2008;168(15):1638-1646

## *A 21-Year Longitudinal Study*

Eliza F. Chakravarty, MD, MS; Helen B. Hubert, PhD; Vijaya B. Lingala, PhD; James F. Fries, MD

**Figure 3.** Progression of disability (PD). Linear mixed models of PD and postponement of disability. Regression lines are derived from linear mixed models and adjusted for the following covariates: age, sex, body mass index, smoking, and initial disability level. The PD is defined as the absolute difference between the 2 groups in the time required to cross a given level of disability. The example shown is to reach a Health Assessment Questionnaire Disability Index score of 0.15.

# Restoration of muscle mass and myofiber size

# Restoration of neuromuscular function

# Major Knowledge Gaps: *Interdisciplinary research priorities*

- **Exercise Biology**

- Dose-response mechanisms.
- Genetic and phenotypic variations.
- Mechanisms by which **inactivity** fosters development and progression of CNCDs.
- Taking advantage of potent exercise stimulus to discover new pathways and molecular targets.

- **Exercise-Drug/Device Interactions**

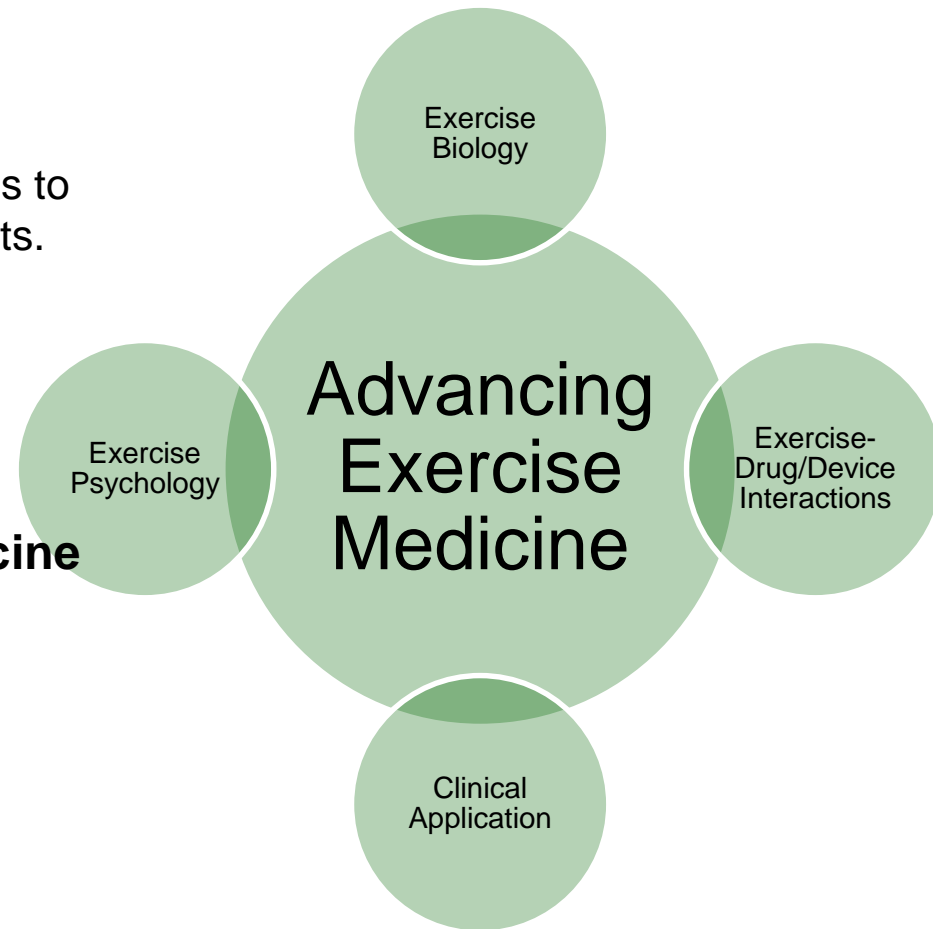

- Differences in drug/device efficacy between active and inactive individuals.
- Synergism, antagonism, drug metabolism.
- Drug re-purposing via exercise responses.

- **Exercise Psychology/Behavioral Medicine**

- Genetic and non-genetic determinants of exercise adherence and lasting lifestyle modification.

- **Clinical Application**

- Optimizing disease-specific and population-specific exercise dosing/prescription to streamline clinical care.
