Multi-Dimensional Aspects of Compounding and Cascading Extreme Events**

APPLIED ECOLOGY

A framework for research on recurrent acute disasters

Gary E. Machlis^{1*}, Miguel O. Román², Steward T. A. Pickett³

Disaster science examines the causes, behaviors, and consequences of hazardous events, from hurricanes to wildfires, flooding, and major industrial accidents. Individual disasters are recurring more frequently and with greater intensity. Recurrent acute disasters (RADs) are sequential disasters that affect a specific locale over time. While disaster science has matured in recent years, understanding of the distinctive characteristics of RADs varies by discipline and lacks predictive power. A theoretical framework is presented by borrowing in part from mathematical topology and disturbance ecology. The recurrent disasters affecting Puerto Rico 2017–2020 are examined as a case example to test the framework. A key variable is the complex characteristics of legacy conditions created by one disaster that influence the effects of subsequent disasters. Substantial improvements in disaster response, recovery, and preparedness can be gained by adopting a RAD-based approach.

CLIMATE  CENTRAL

Recurrent acute disasters (RADs) are individual major hazard events that occur in a specific locale and create legacy conditions that impact future disasters in that locale.

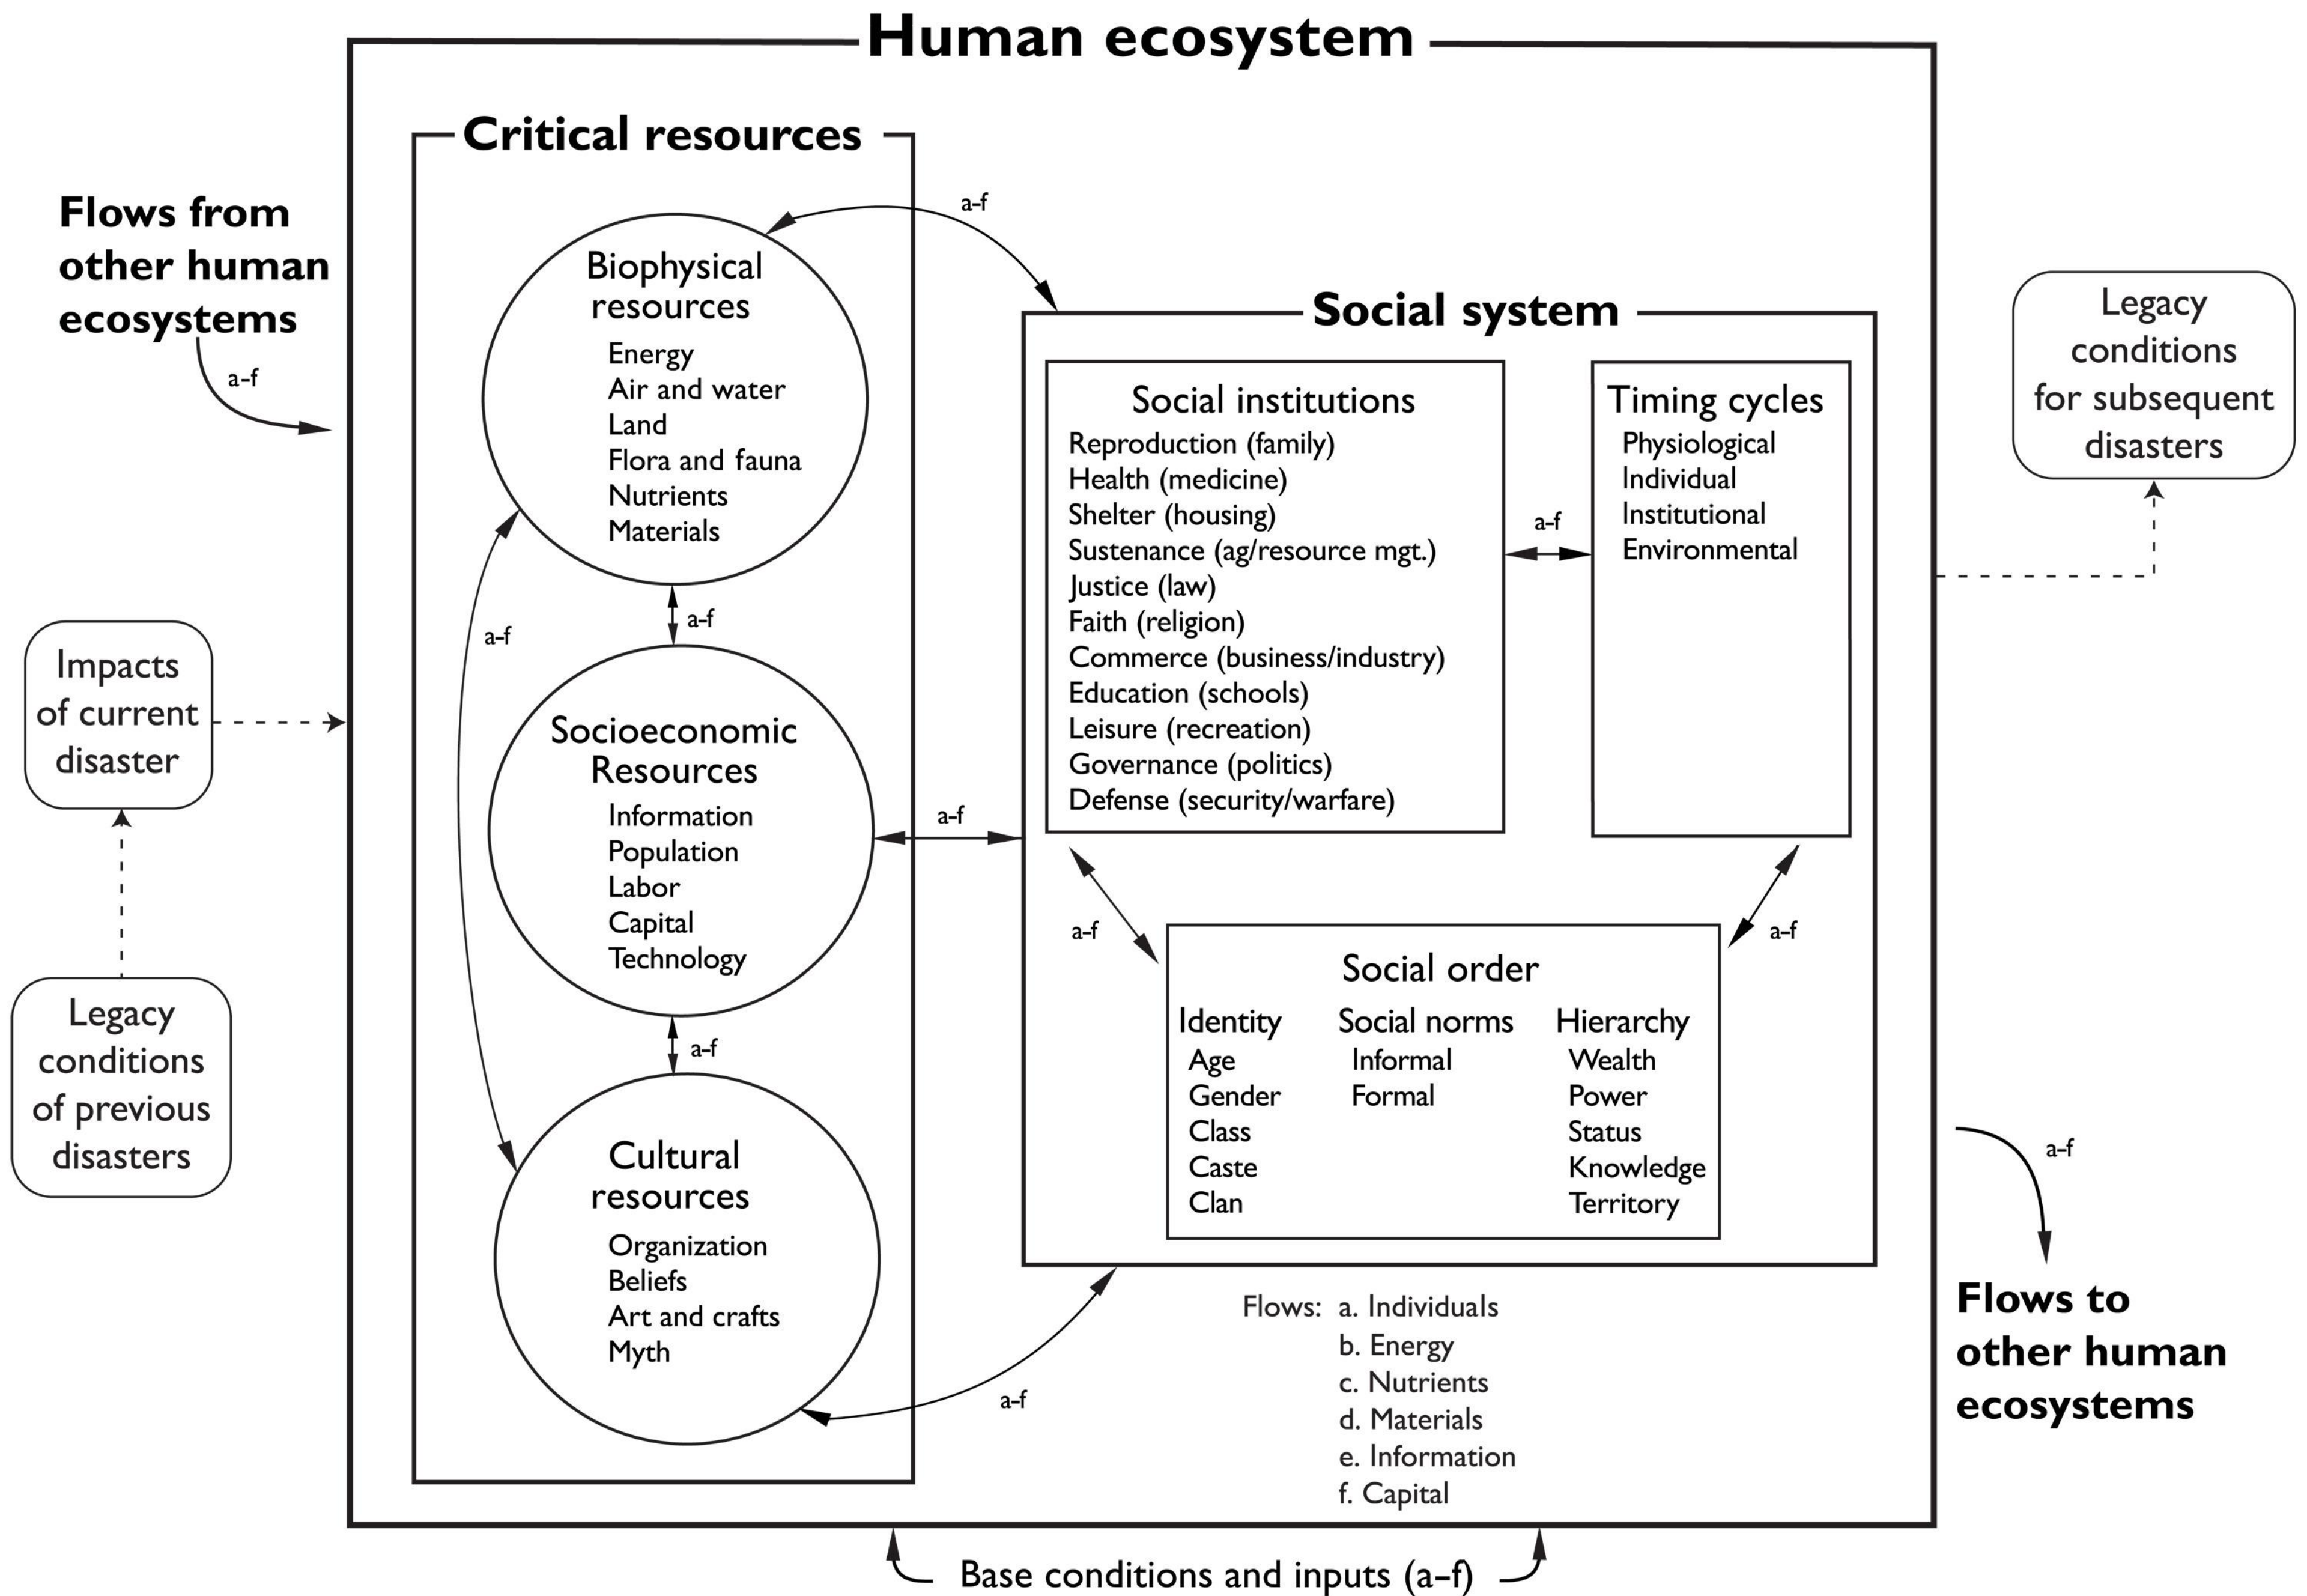

Applied Research Questions

- Is there a distinctive signature to recurring acute disasters and their impacts upon human ecosystems?
- If so, what are the key legacy conditions that create these distinctive signatures, and can a theory be developed that could predict them?
- If so, what policies, programs, and actions can be undertaken to mitigate the harmful effects of recurring acute disasters, and support safety, protection of human life, and community resilience in the face of these recurring events?

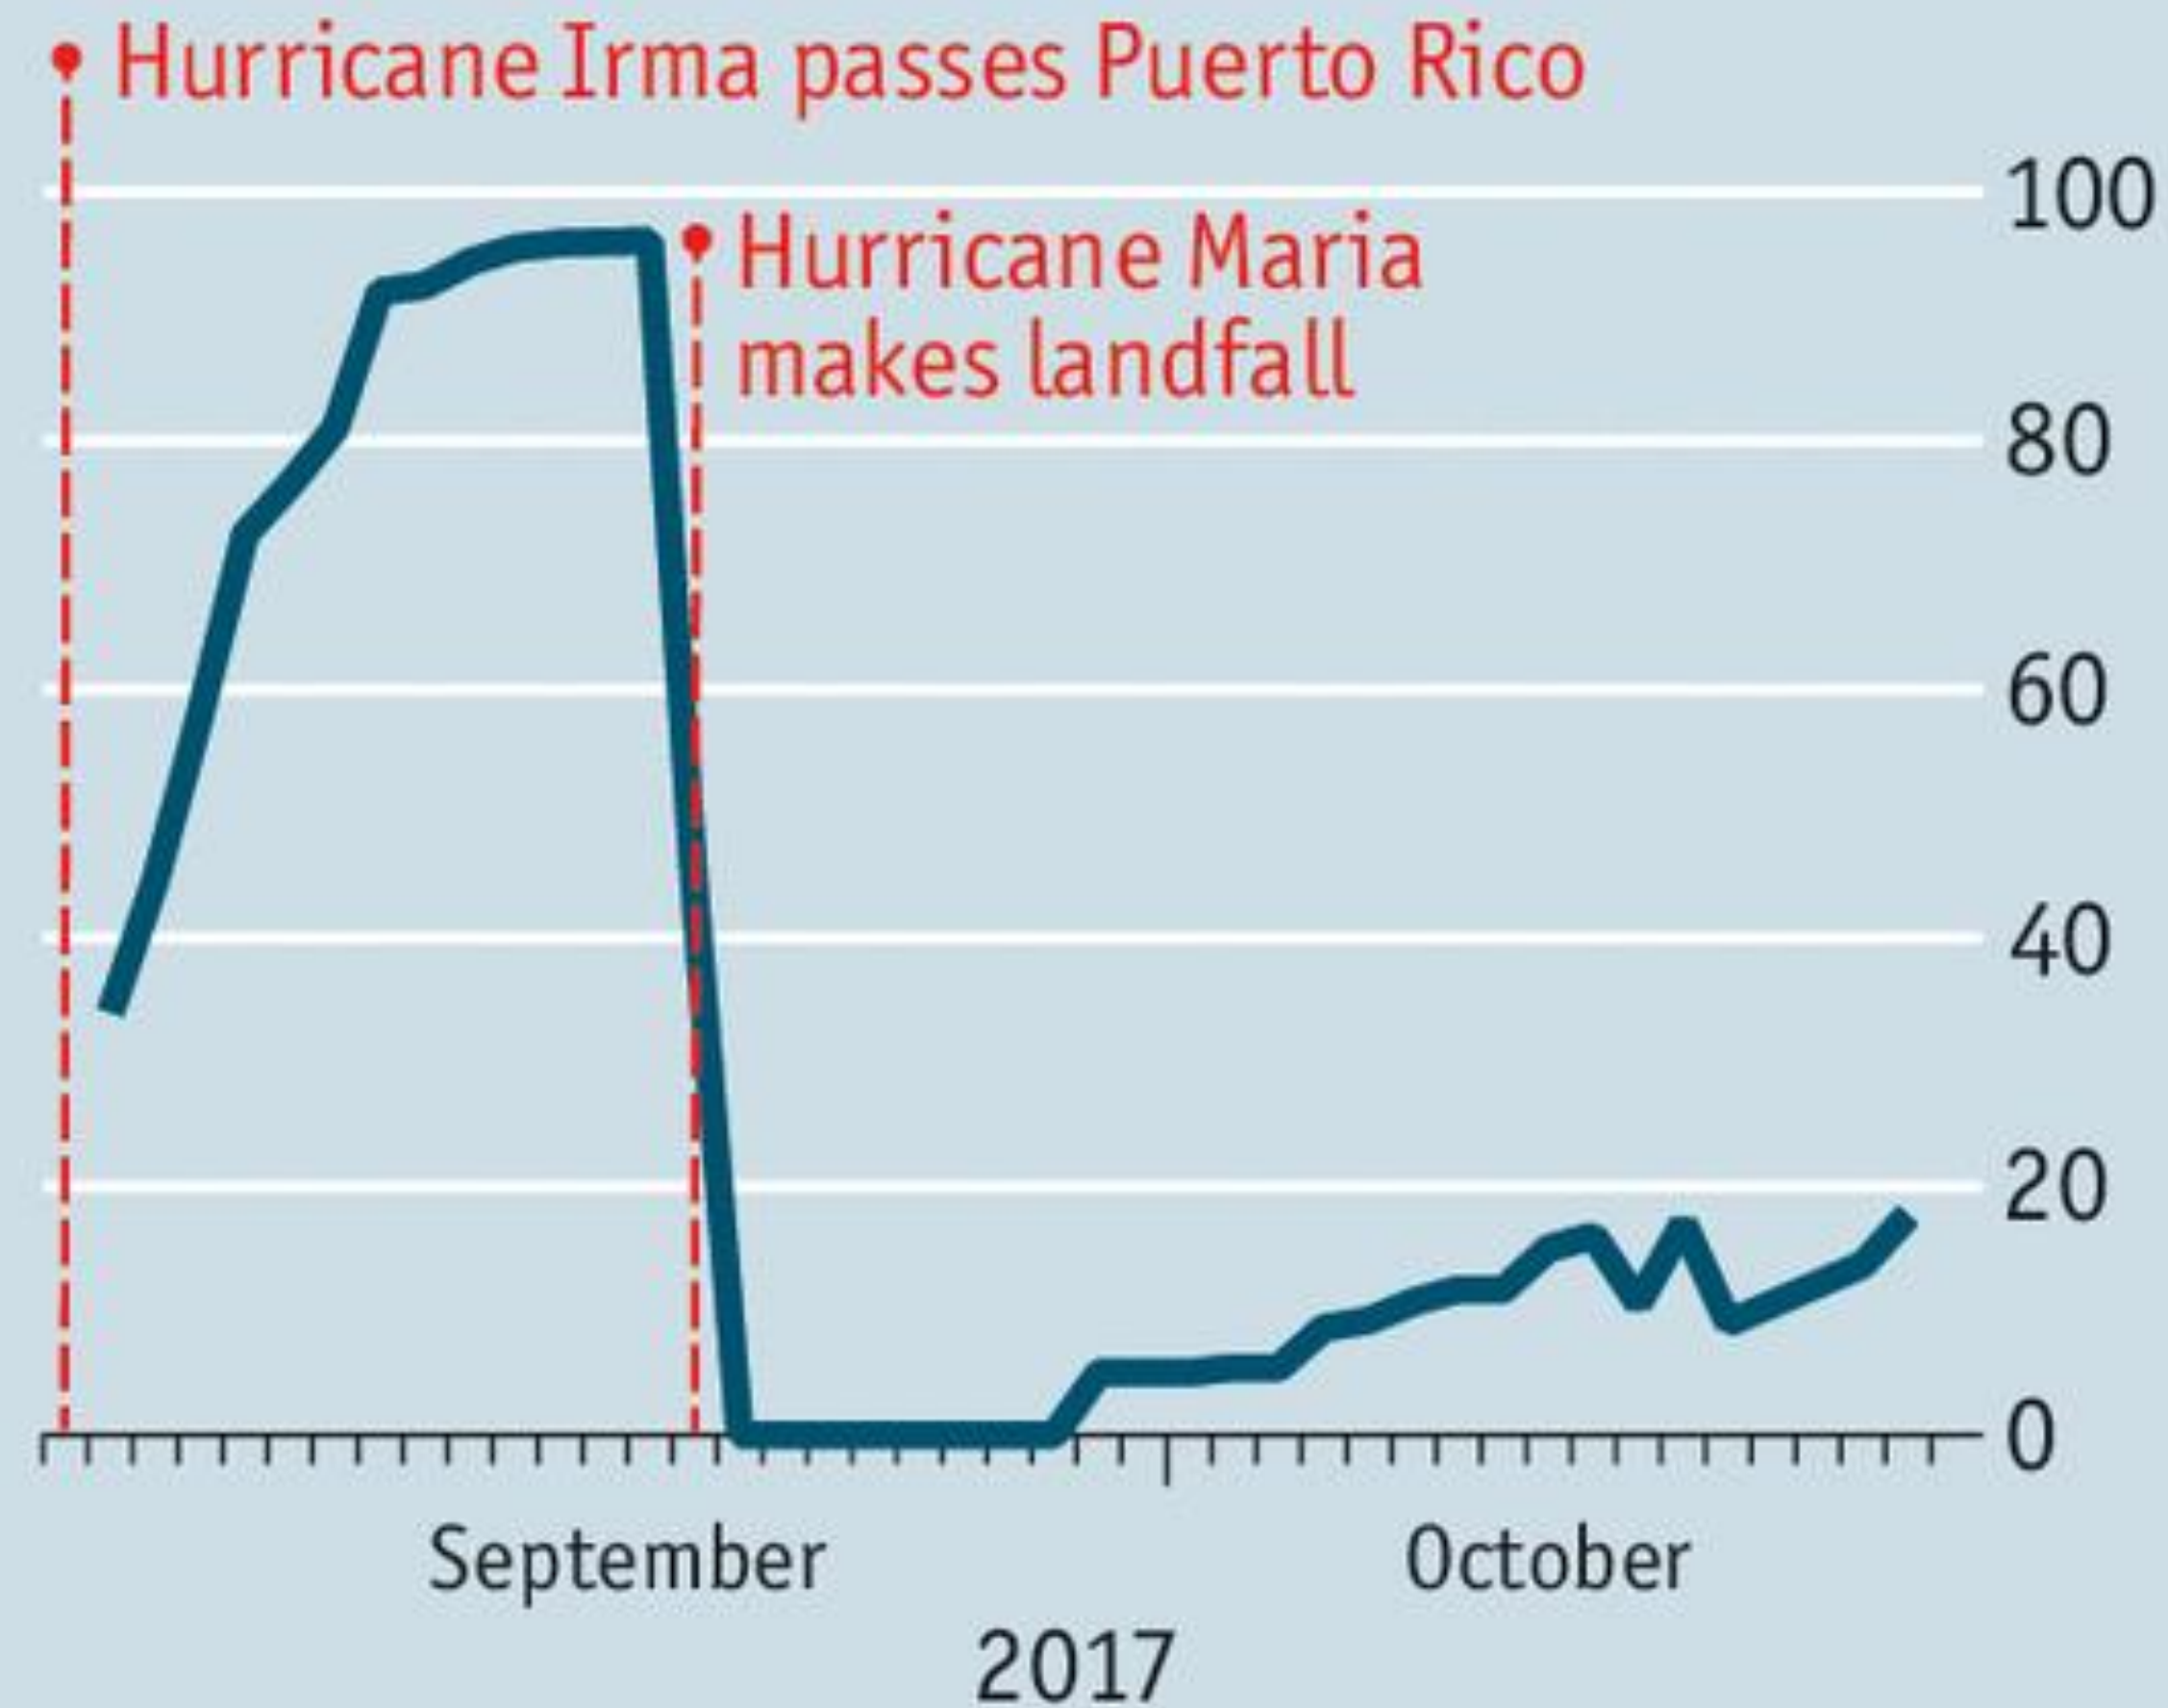

A Case Study: Puerto Rico 2017-2020

- Hurricane Irma, 7 September 2017
- Hurricane Maria, 20 September 2017
- Island-wide drought, 11 February – 5 November 2019
- Earthquake series, 5-6 January 2020

Legacy Conditions...

- \$ 90 billion dollars in damages
- -15% loss in GDP
- +4,645 lives lost
- Migration of +200,000 persons
- Emotional Impact: unknown

RAD Policy Implications

- *Improved scientific understanding of RADS and their legacy conditions*
- *Damage and needs assessments, incident response plans, building codes, public health regulations, insurance premiums, emergency communications, prepositioning of resources, community preparedness training*
- *Potential to advance disaster science, improve disaster response, build resilience to future disasters, and save lives*

“Increasing our understanding of Recurrent Acute Disasters (RADs) has the potential to advance disaster science, improve disaster response, build resilience to future disasters, and save lives.”
