Department of Transportation

Transportation Resilience Metrics

Presentation to National Academy of Sciences
September 14, 2020

Lizzie Kemp, Resiliency Program Manager

Resiliency:

“The ability to **prepare** and **plan** for, **absorb**, **recover** from, or more successfully **adapt** to adverse events.”

The 4 Rs: Attributes of Resiliency

- ❑ Robustness - the strength of an asset or system to withstand relevant threats
- ❑ Redundancy - the presence of a backup system or plan
- ❑ Resourcefulness - ability to identify, diagnose and treat problems with available resources
- ❑ Rapidity - ability to restore functionality in a timely way

Physical and Organizational Resiliency

Resiliency for a DOT can be:

Physical - the ability of the physical assets to perform to an acceptable level when subject to a hazard event;

and/or

Organizational - an organization's capacity to make decisions and take actions to plan and respond to a hazard event to achieve a desired result.

Both are important!

How Events Disrupt our System

Events disrupt how our system works.

Building resiliency into how we do things minimizes the disruption.

CDOT Lessons Learned

1976 and 2013 floods in Colorado destroyed many of the same facilities

US 34 1976

US 34 2013

What can we do now... to avoid this in the future?

New CDOT Tools and Policies: Measuring Vulnerability and Risk

CDOT Resiliency Program

- Created in 2018, with Policy Directive 1905.0 - the vision for resilience at CDOT
- Works to integrate resilience in CDOT functions
- Coordinates resilience activities at CDOT
- Conducts research to support resilience
- Provides resilience knowledge and resources to CDOT staff

COLORADO DEPARTMENT OF TRANSPORTATION		<input checked="" type="checkbox"/> POLICY DIRECTIVE <input type="checkbox"/> PROCEDURAL DIRECTIVE
Subject		Number
Building Resilience into Transportation Infrastructure and Operations		1905.0
Effective	Supersedes	Originating Office
11/15/18	New	Division of Transportation Development

I. PURPOSE

The purpose of this Policy Directive is to implement the principles of resilience into Colorado's transportation system practices. This will enable the Colorado Department of Transportation to proactively manage risks, minimize disruptions and adapt to changing conditions in order to provide continuous transportation service in Colorado. Colorado's transportation infrastructure directly or indirectly affects the lives of all people living in the state, and provides the essential services that underpin the state's economy and the movement of people, goods, and information. Maintaining a secure, functioning, and resilient infrastructure is critical to the state's safety, prosperity, and well-being.

The benefits of resilience are widespread, including fiscal benefits by saving the state money, social and economic benefits, by saving the public time and ensuring timely access to markets for businesses, and safety benefits, by taking action before a disruption becomes disastrous.

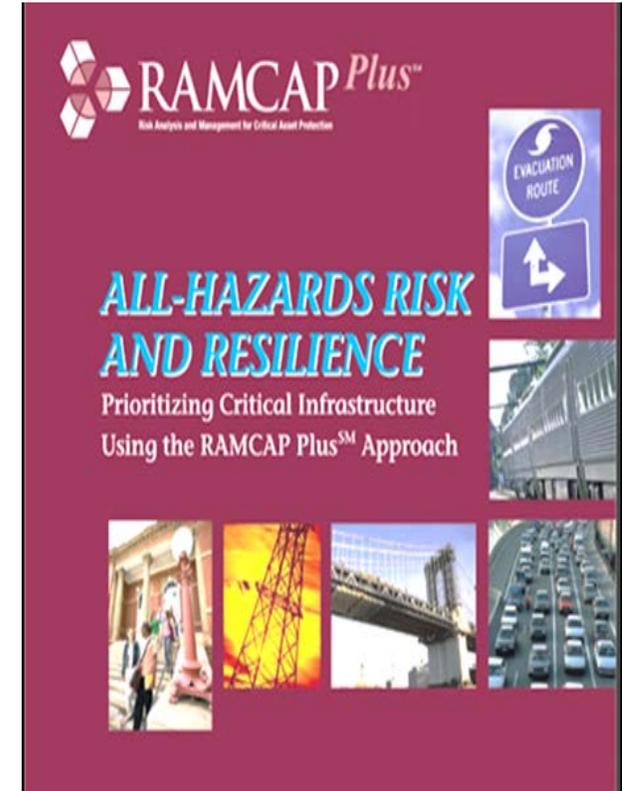

Integrating Resiliency at CDOT: Maintenance & Operations

I-70 Corridor Risk & Resilience Pilot

- “Pilot” the data, assumptions, and methodology needed to quantify:
 - What are CDOT’s **assets**?
 - Location, value, condition, criticality
 - What are relevant **physical threats**?
 - Likelihood and location
 - What **impact** would they have on our system?
 - Consequences and vulnerability
 - What are the **optimal investments** we can make now to improve resiliency in advance of future events?

BUILDS ON THE 7-step RAMCAP MODEL USED IN FLOOD RECOVERY

Risk (<i>R</i>) (\$)	→ Potential cost of asset losses in a threat-filled environment
Consequence (<i>C</i>) (\$)	→ Result of asset failure
Vulnerability (<i>V</i>) (%)	→ Susceptibility to the threat
Threat Likelihood (<i>T</i>) (%)	→ Potential of threat occurrence

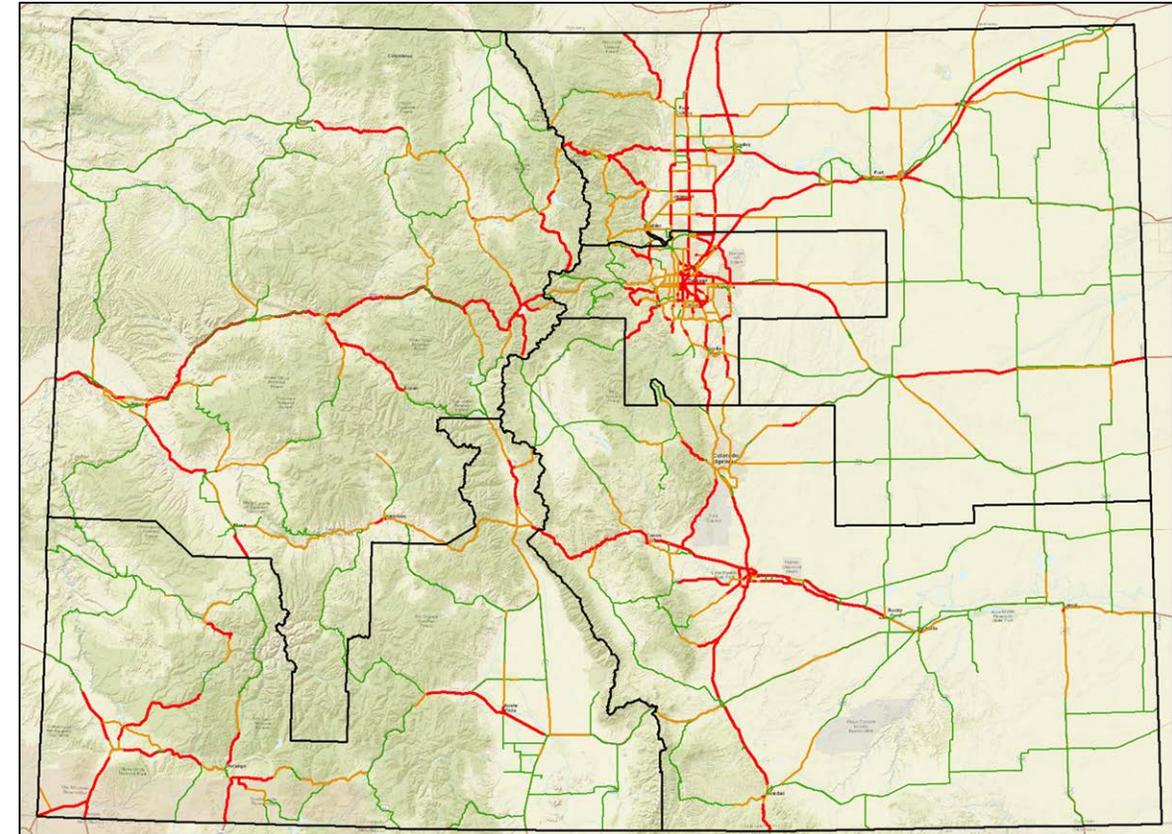

Some Roadways are more Critical than Others

Criticality Map for System Resilience

AADT	16.7%
ASHTO Road Classification	16.7%
Freight \$ (County)	16.7%
Tourism \$ (County)	16.7%
SoVI	16.7%
Redundancy	16.7%

Equal Weight	
█	53.8% Low
█	25.5% Moderate
█	20.7% High

	SOCIAL	ENVIRO	ECON
Usage: AADT + Roadway Classification	✓	✓	✓
Economic Impact: Freight (\$) + Tourism (\$)			✓
Social Impact: SoVI	✓		
System Impact: System Redundancy	✓	✓	✓

Result - Annualized Risk (\$ per threat-asset pair)

Given the worst reasonable event, what are the consequences? (\$)

Owner Cost

- Asset Replacement Cost

User Cost

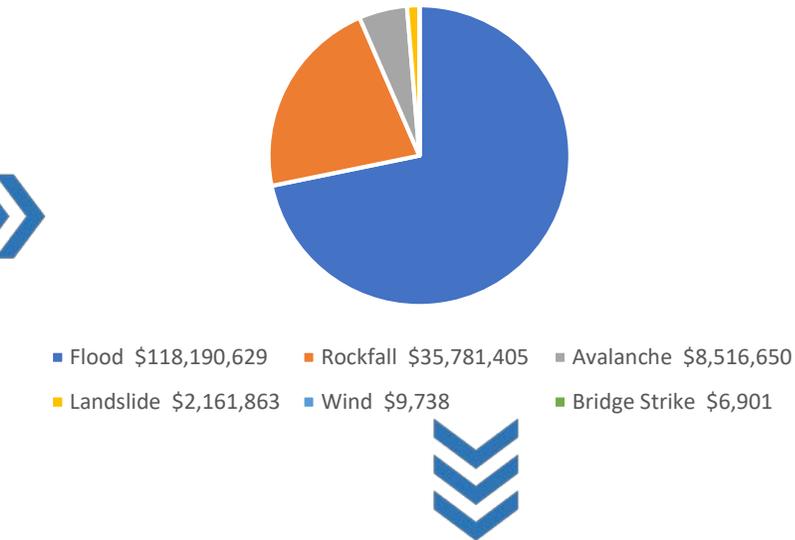

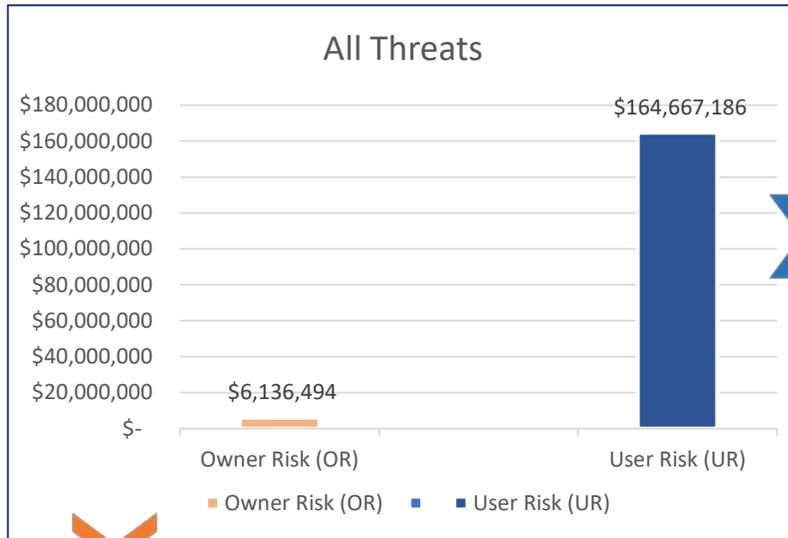

- Value of time (delay/detour)

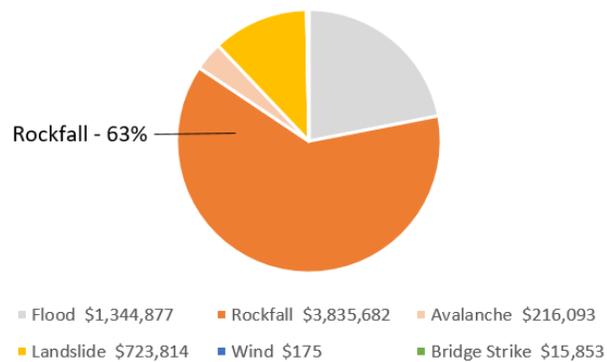

I-70 Pilot Results

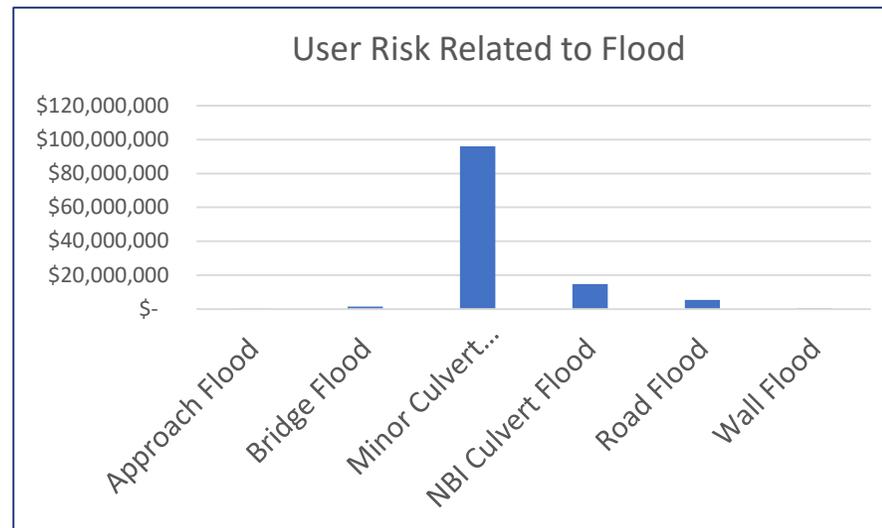

User Risk -- Share of Each Threat

Owner Risk - Share of Each Threat

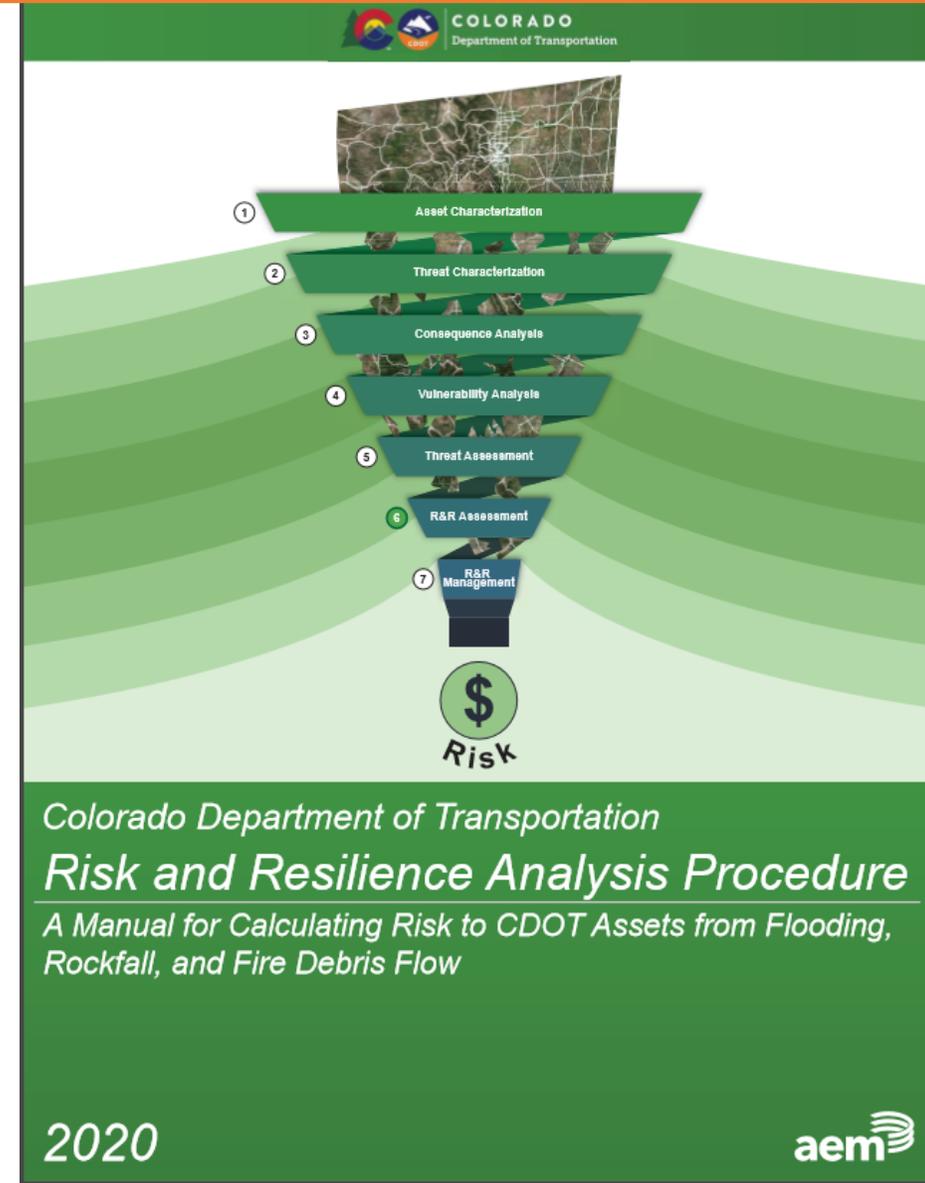

User Risk Related to Flood

Risk and Resiliency Standard Manual

- Published August 2020 --
<https://www.codot.gov/programs/planning/cdot-resilience-program>
- Refines and Standardizes the data, assumptions, and methodology for conducting risk assessment
- Step by step “Cookbook” on how to calculate risk
 - Flood
 - Rockfall
 - Fire / Debris flow

Calculates output risk data here

Spreadsheet tabs for each threat asset pair

Calculating Reduced Risk and Benefit Cost

Run the risk model twice

- Once to determine the existing condition and establish baseline risk costs
- A second time to analyze the risk reduction of the mitigation proposed
- Estimate cost of proposed mitigation
- Those values can be used to determine a Benefit to Cost ratio

EQUATION 5.1.3

$$\text{Mitigation Annual Cost} = \text{Mitigation Present Cost} \times \frac{i \times (1 + i)^n}{(1 + i)^n - 1}$$

Where:

- i = discount rate (3.3% for CDOT)
- n = life expectancy of mitigation

EQUATION 5.1.1

$$B/C = \frac{\text{Mitigation Benefit}}{\text{Annual Cost of Mitigation}}$$

Excel Templates - Challenges

- Some input data is not readily available
 - Detour routes and times not available statewide
- No easy way to “batch” process many locations at once in an automated way.
 - E.g Water flow (from Streamstats – need to batch process)

Problem:	Flood				Equations:	Step 1: Threat Data Collection	Step 2: Asset Data Collection	Step 3: Owner Consequence	Step 4: User Consequence

Detour Times are a Critical Input Using the State-wide Travel Demand Model for Detours

- Minimize travel time (weekday 24-hour average)
- Limit detours to state highways
 - Colorado
 - Neighboring states
- Travel each highway route in each direction
 - One at a time, close each link and find the new minimum-time path

I-76 Test for the Detour Model

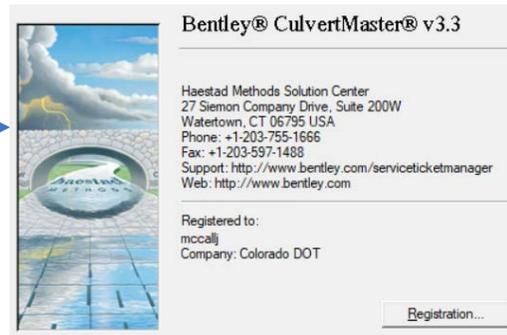

I-76 Test for the Detour Model

With In-house staff expertise:

- Time consuming manual process previously performed on a culvert-by-culvert basis has been refined to a two input automated tool
- Can be used by anyone with access to an ArcGIS Pro license and takes two shapefiles as input: culverts and detours
- Exports results to a single spreadsheet for all culverts

Using the Data and Tools
to Make Decisions:
Prioritizing Which Risks
to Mitigate

Resiliency Integration Project

- Kicked Off - February 2020
- Goal - Demonstrate how to drive the ideas of resilience into CDOT day-to-day activities
- 5 case studies - proof of concept
 - Asset Management - Twice Damaged Assets **UNDER WAY**
 - M & O - Flood Mitigation Plans for Minor Culverts **KICKED OFF LATE JULY**
 - Planning and Project Prioritization
 - Environmental Documents
 - Project Scoping and Engineering
- Project Completion - 18 months - late 2021

Coming Soon

Twice Damaged Assets Case Study

Twice Damaged Assets Case Study

November 2020 Deadline

CDOT must prepare evaluations of twice damaged assets before including in the STIP.

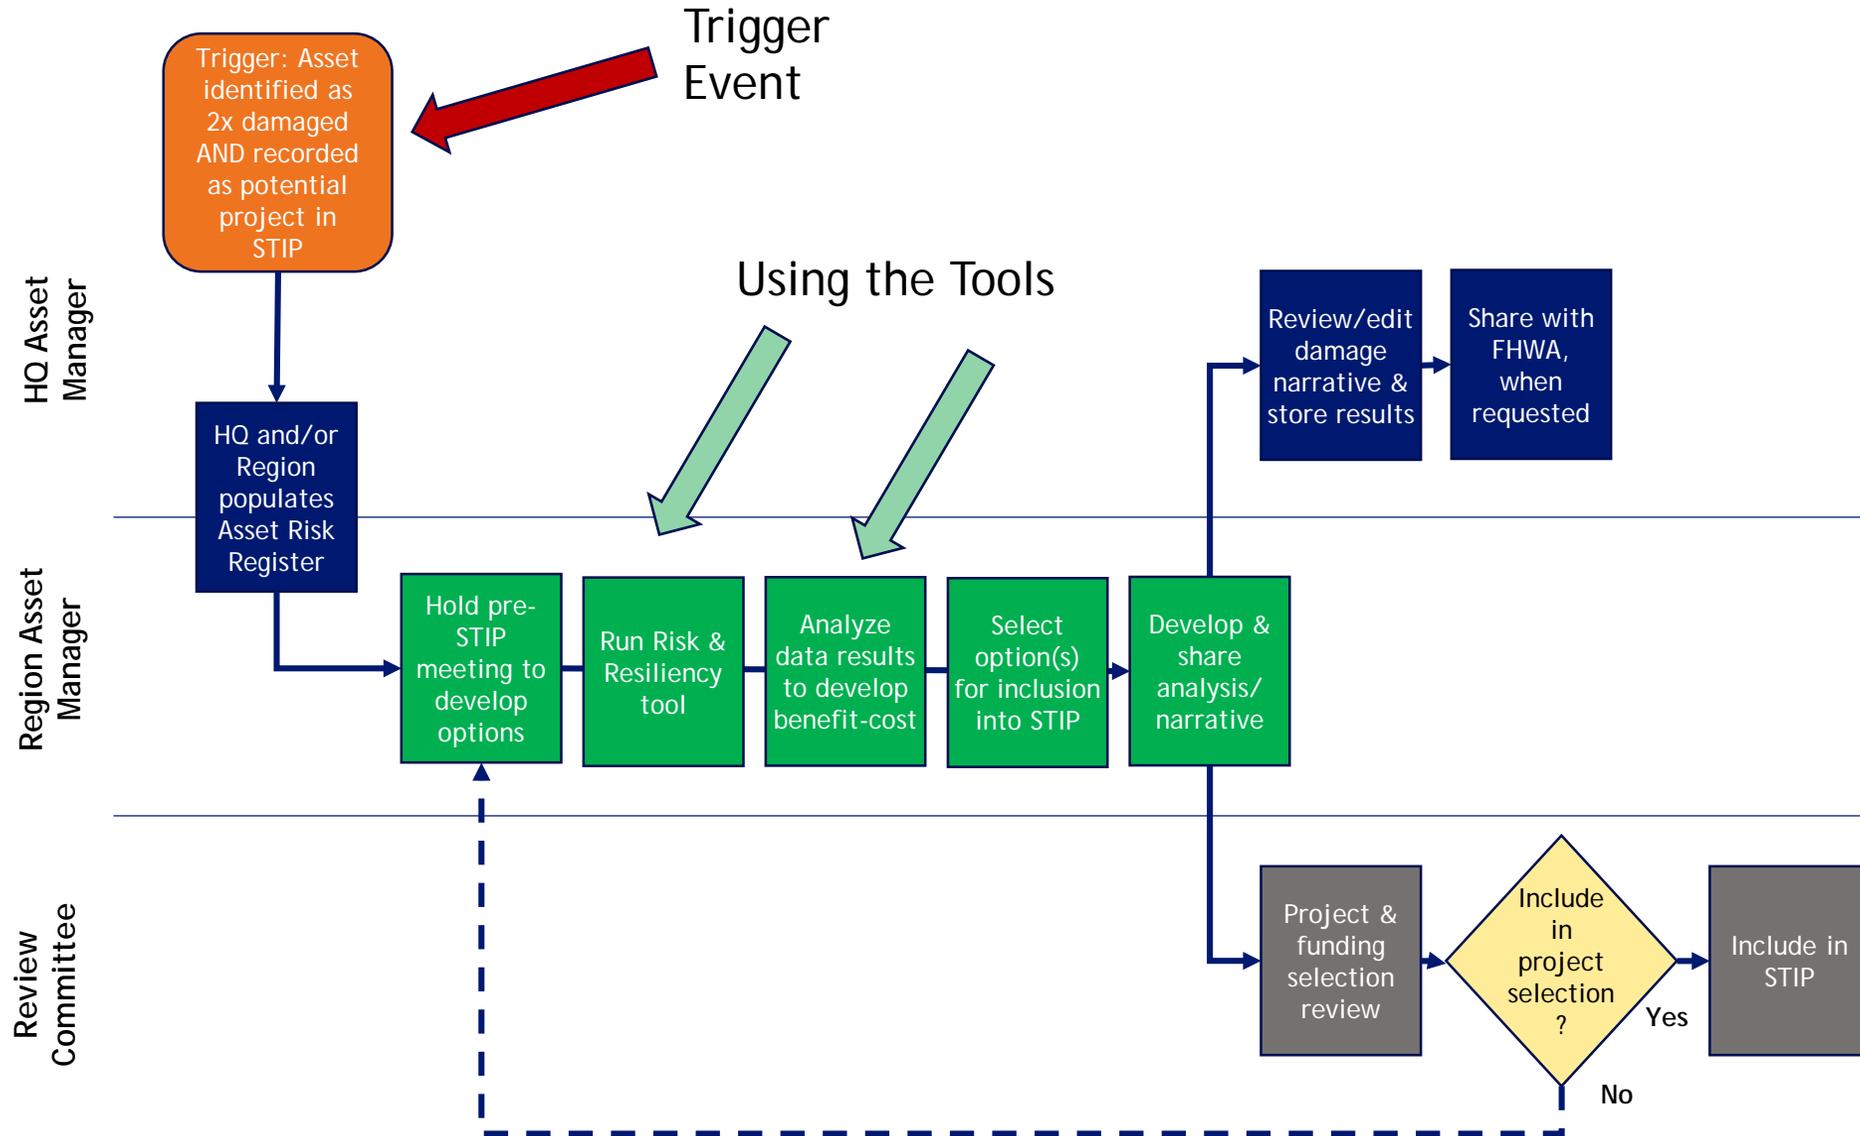

Why are we doing this?

23 CFR 667 - Evaluations of Facilities Repeatedly Requiring Repair and Reconstruction from Emergency Events

- Conserves federal resources, protects public safety
- DOTs must conduct periodic evaluations to identify road, highway, and bridge assets with repeated repair and reconstruction stemming from emergency events since 1997
- Must determine if reasonable alternatives exist to mitigate risk, prevents repeated investment in assets facing recurring damage

Draft Process Flow: Twice Damaged Assets

Twice Damaged Assets Case Study

Locations to analyze:

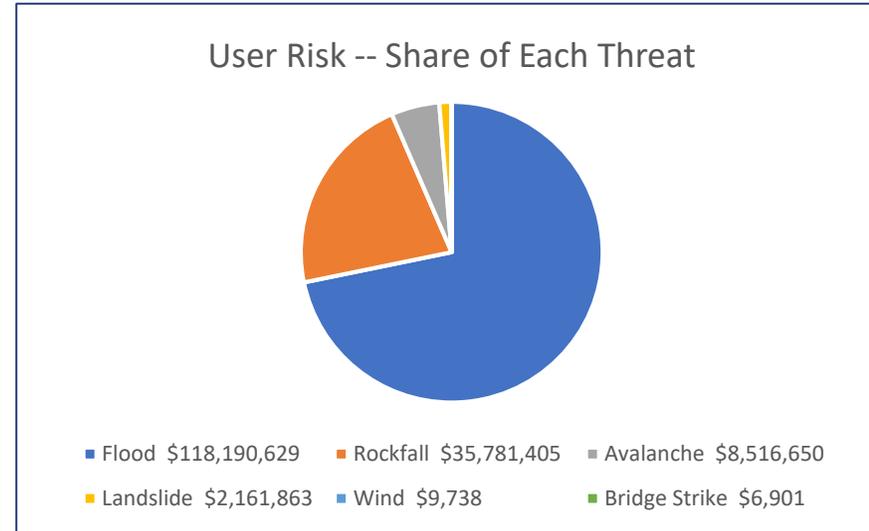

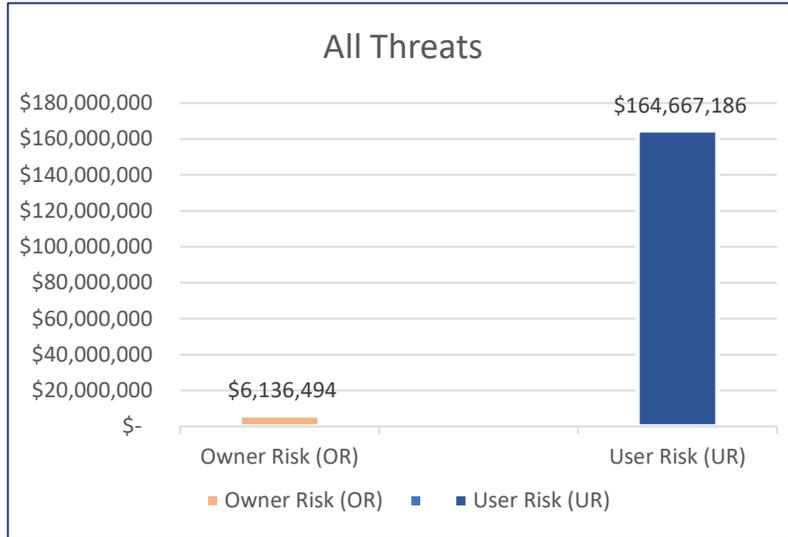

- ❑ US 34 Big Thompson Canyon - Pavement/roadway loss
- ❑ I-25 in El Paso County (MP 144 and 155) - Culverts/bridges
- ❑ Glenwood Canyon - Rockfall resulting in pavement/bridge damage
- ❑ Dowd Canyon Landslide Complex
- ❑ US 24 Waldo Canyon - Debris Flow systems, pavement @ debris flow systems, drainage systems including pavement/roadway loss
- ❑ SH 71 (2013 and 2015 events) - Pavement damage

Culvert Mitigation Planning

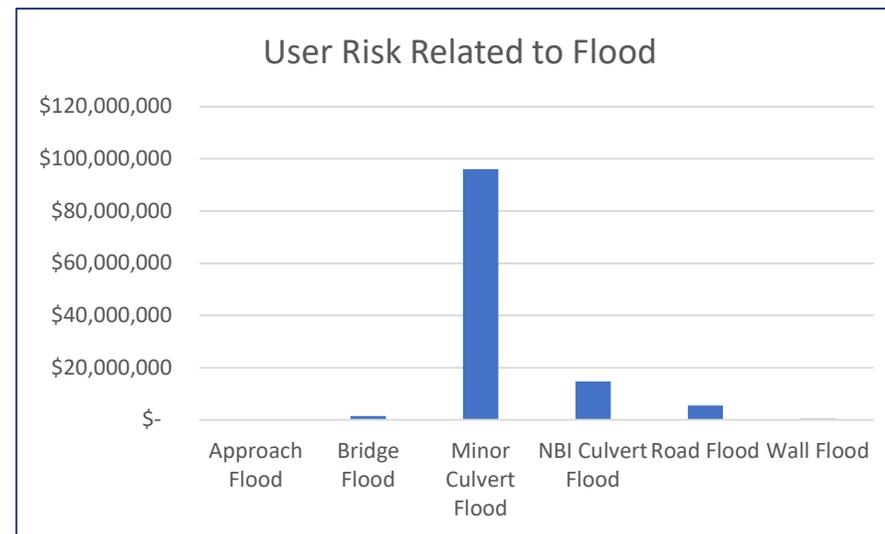

Small Culvert Risk Mitigation Planning Case Study

Decision – Focus on minor culverts

Small Culvert - Risk Mitigation Planning Project

4 Step Process:

Step 1. Identify a high-risk subset of culverts

Step 2. Culvert Field inspection

Step 3. Develop a prioritized Region treatment plan

Step 4. Calculate risk and potential risk reduction. Recommend to the EMT a list of risk mitigation projects for culverts that meet the target B/C

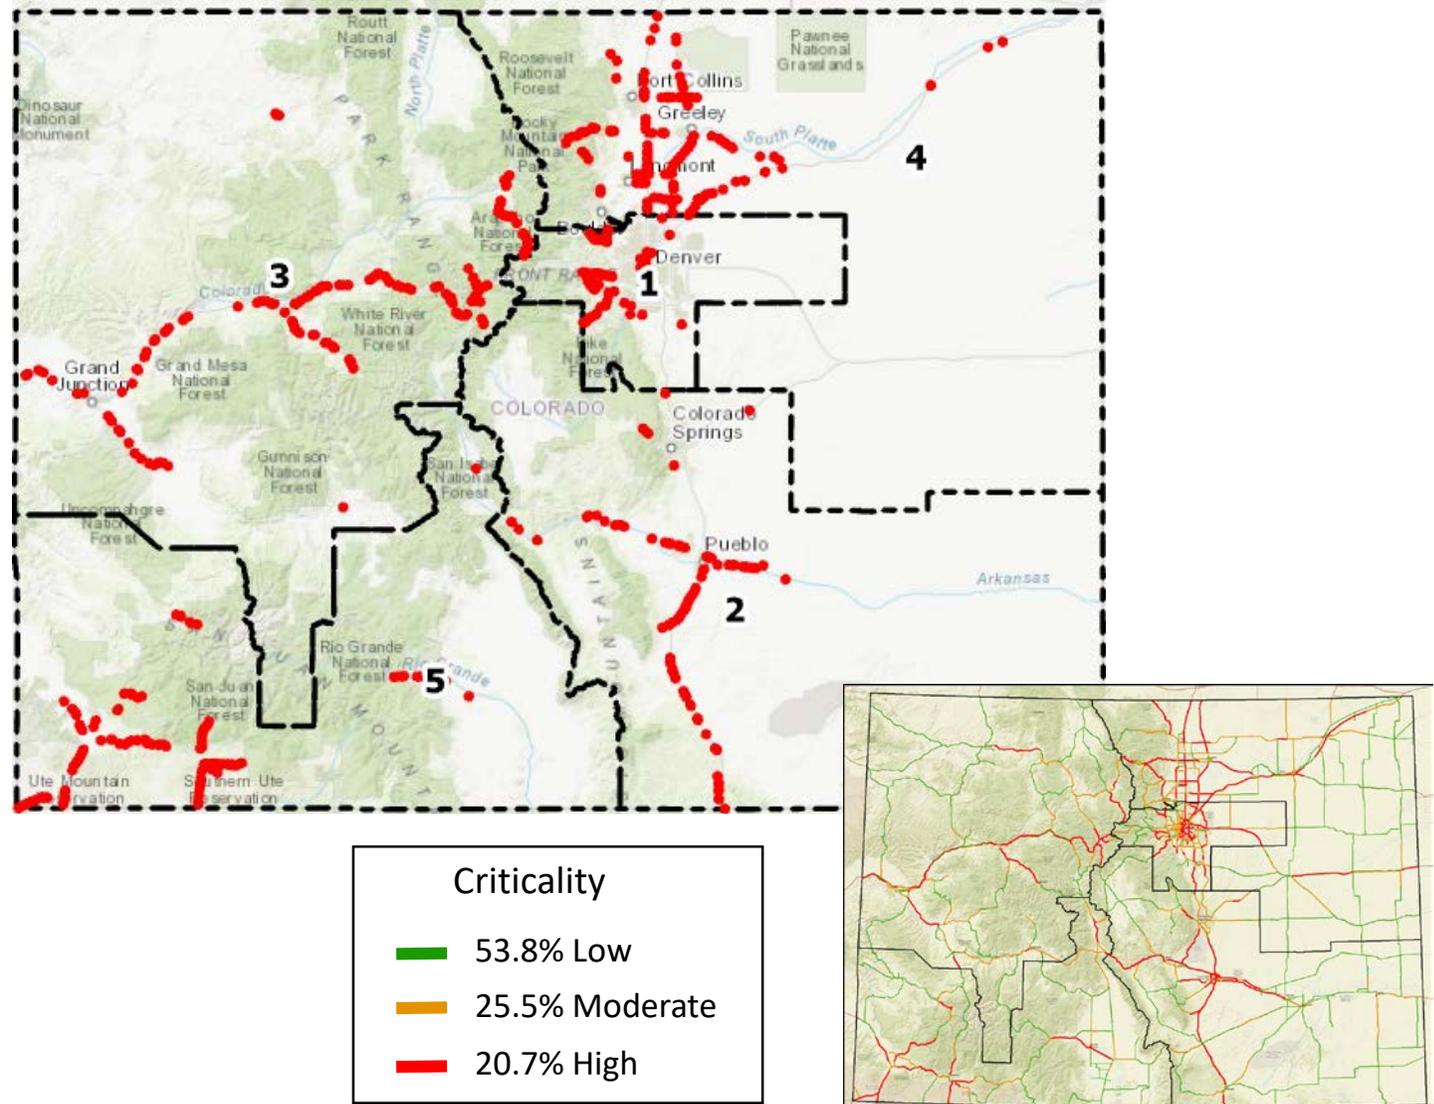

Step 1. Prioritizing At-Risk Culverts

- With just under 65,000 culverts under 4 feet across the state, which subset should we focus on first?

Proposal:

- Focus first on culverts in poor condition that are also on critical routes
- 500 - 1,000 culverts statewide

Step 2. Culvert Inspection

This fall, over 35 identified maintenance staff will inspect the culverts with field visits and standardize condition data using:

- ESRI Collector App - NEW
- Staff Bridge Rating Guide for Small Culverts and Drainage Structures

Step 3. Risk Mitigation Plans

Develop Region Treatment Plan and Prioritize Potential Mitigation Projects

Step 4. Propose Small Culvert Improvements Where they Make Sense

GOAL:

Based on solid, standardized data, recommend a project list and funding for culvert improvements that meet a justifiable benefit cost (B/C) in order to reduce CDOT risk.

Potential Next Steps – 2020-2021 Projects

- Finish the 5 case studies –
 baking resiliency into day to day CDOT business
- Revise manuals, etc to memorialize new procedures
- Develop Performance Measures for Resiliency
- New Redundancy measure – and statewide detour map
- Prepare for Federal Resiliency Funding! (if and when it comes)

Extra Slides

Flood Recovery - FHWA and CDOT: Partnership to Build Back Better

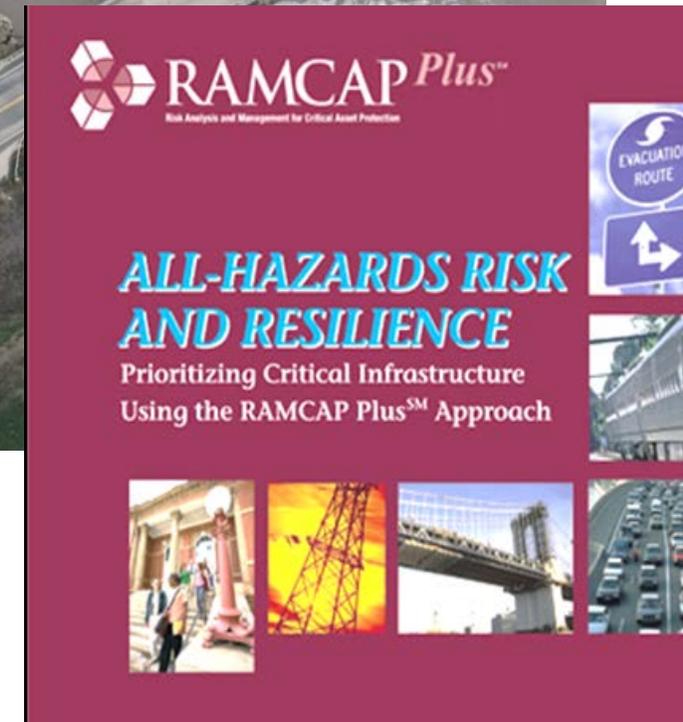

- Agreement on methodology was key - RAMCAP
- Used flexibility allowed in the Emergency Relief Program
- Quantitative demonstration of how building back better made sense from a \$\$ B/C standpoint.

Of note: flexibility in ER program has not been the case in many other parts of the country

CDOT/FHWA Risk Review Process: Agreement to Use the 7-Step RAMCAP Model

- How likely is it that future events will happen?
- Which routes are most “critical” for us?
- How vulnerable are our facilities?
- How much will it cost? consequences (\$)
- Will “betterments” reduce future risk?
- What’s the cost of betterments compared to reduced risk? B/C?
- Demonstrate to FHWA that building back better makes good long-term financial sense (Benefit - Cost analysis)

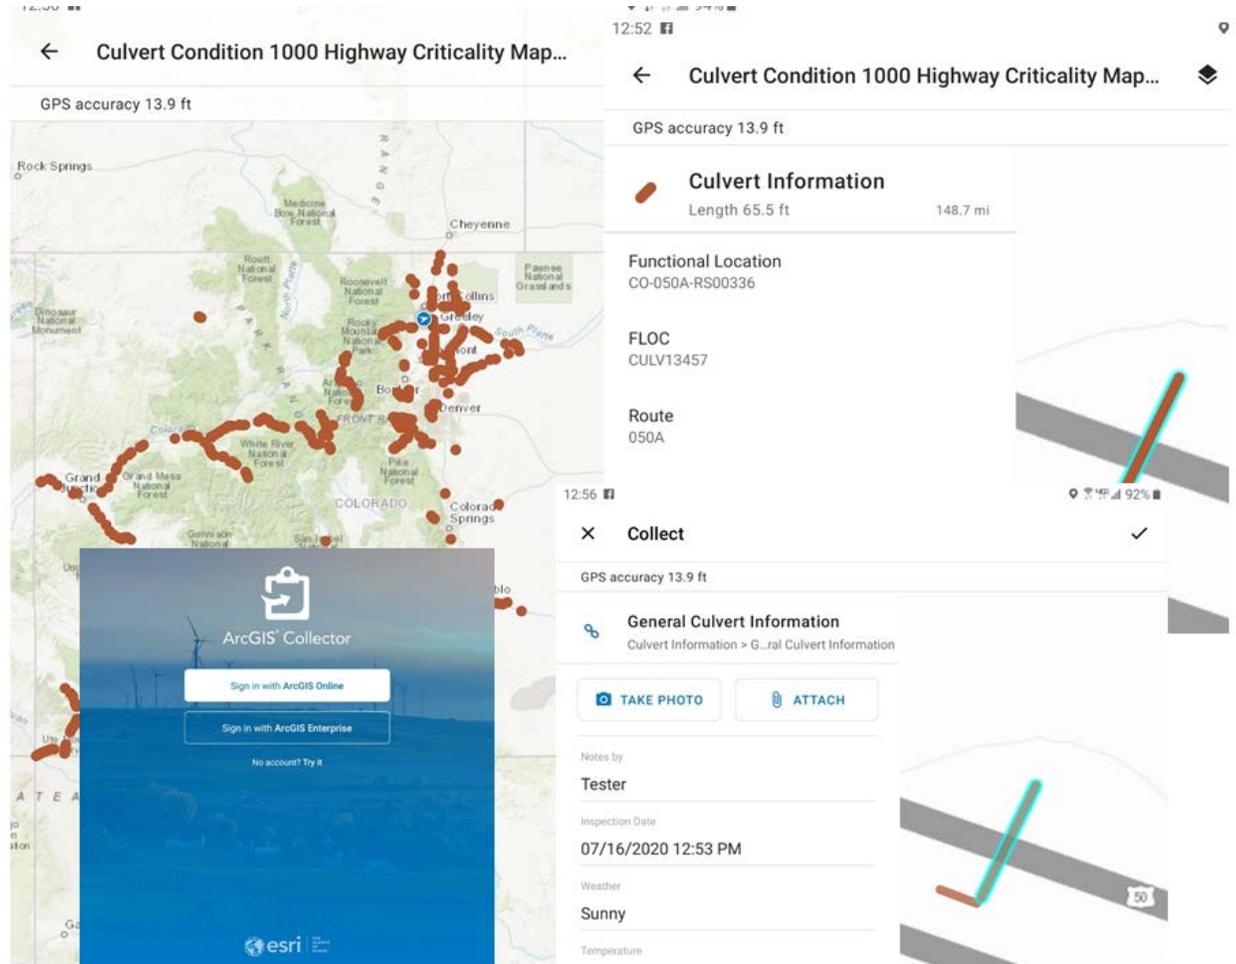

Step 2. ESRI Field Collector App

Culvert Condition App

It uses ESRI Collector for ArcGIS to collect culvert condition data.

- User selects/clicks on a culvert of interest.
- Show culvert information.
- A set of forms allow users to fill out general and inlet/outlet culvert conditions information.
- Submit data during collection time or later.

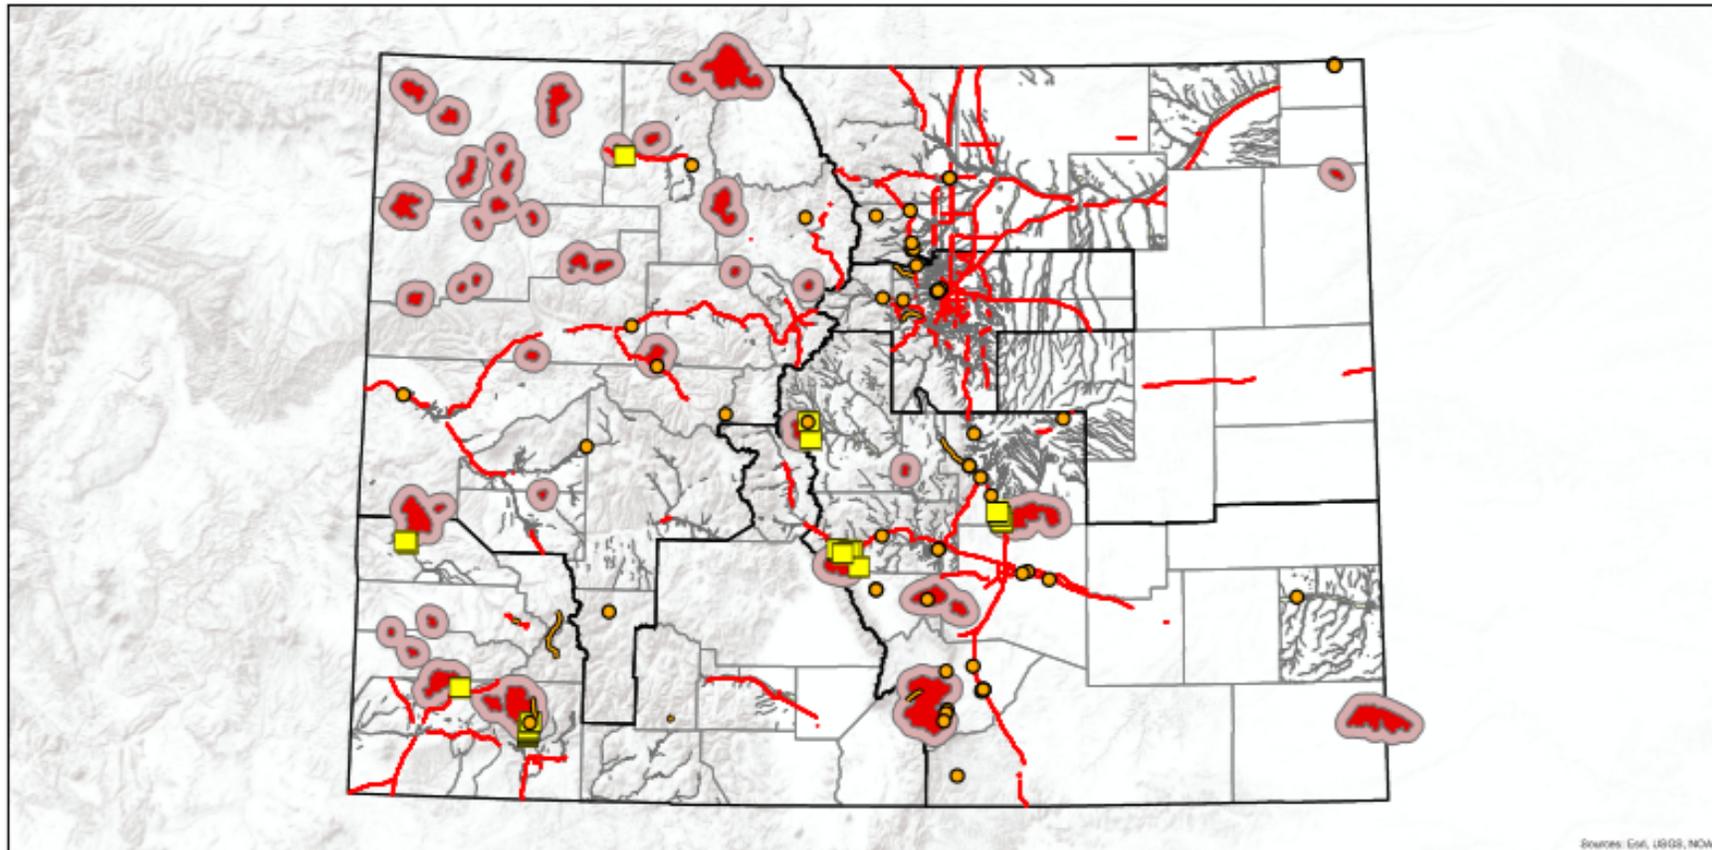

Hot Topic: Post-Fire/Flood and Debris-Flow Mitigation

CDOT 2019 Fire/Flood & Debris-Flow Mitigation Planning

Flood Vulnerability Analysis

Sources: Col, USGS, NOAA

Methodology:

Data Preparation: After gathering the necessary datasets, a few simple processes were run in order to prepare the data for analysis. Burn scars were given multi-ring buffers to include areas within 1 and 5 miles of the original burn scar. Bridges and Culverts were given a simplified scour rating of 1-4 with 4 being those assets with the worst scour rating. Criticality was symbolized using the standard values of 1-3 with 3 being the most critical roadways. Finally, 100- and 500-year flood plains were selected from the National Flood Hazard Layer (NFHL).

Analysis for Highest Flood Danger Assets: Analysis involved using the select by location tool to identify those road sections and assets that overlaid both the flood plains and areas in and around the burn scars

- Regional Priority Assets
- Regional Priority Assets
- Analysis Results Assets
- High Criticality Road Sections
- 100 Year Flood Plains
- 2016-2018 Burn Scars with Buffers
- 500 Year Flood Plains
- 1 mi
- 5 mi

Risk and Resiliency Standard Manual

- Published last week – available on the CDOT Resiliency Program Website!
<https://www.codot.gov/programs/planning/cdot-resilience-program>

- Includes Post-fire / Flooding and Debris-flow as one of the standardized risk calculations.

Junkins	\$8,980	\$1,130	\$20,440	\$4,190	\$29,420	\$5,320	\$34,740
Cold Springs	\$20,150	\$9,530	\$4,850	\$3,330	\$25,000	\$12,860	\$37,860
TOTAL					\$3,163,320	\$2,760,960	\$5,924,280

Summary of Impacted Assets

Exhibit 4.3.4 includes the statistics of assets anticipated to be impacted by debris flow across the four fires. The 416 fire is anticipated to impact the most CDOT assets, with 35 road segments totaling more than 3 miles of roadway anticipated to be impacted by projected debris flow. In addition, 23 culverts are at risk for debris flow near the 416 fire.

**EXHIBIT 4.3.4
SUMMARY OF
IMPACTED
ASSETS**

Fire	Location	Miles Impacted	# of Road Segments	Culverts Impacted
416	US 550	3.06 mi	35	23
Spring Creek	US 160	0.56 mi	13	6
Junkins	CO-165	0.29 mi	4	3
