

# NOAA UPDATE and STRATEGIC DIRECTION

Joint Spring Meeting of the  
ASEB and the SSB 2021

National Environmental Satellite,  
Data, and Information Service

May 27, 2021

Stephen Volz, Ph.D., Assistant Administrator

# Agenda

- Why Now Matters
- Global Satellite Earth Observation Environment
- Four Pillars of NESDIS
- Scoping the Resources Required

# Why Now: More Storms, More Severity

## KEEPING US SECURE

The estimated value of NASA and NOAA information services to the U.S. Navy's operational effectiveness is **\$2 billion** per year.

The U.S. Navy and other U.S. defense agencies partner with NASA and NOAA to use satellite data, to access operational services, and to leverage their scientific progress.

## MITIGATING NATURAL DISASTERS

Extreme weather and fires have cost the federal government more than **\$350 billion** over the past decade.

Satellite measurements play a critical role in tracking the paths of hurricanes and wildfires so that we can warn populations at risk, assess the damages, and avoid future costs.

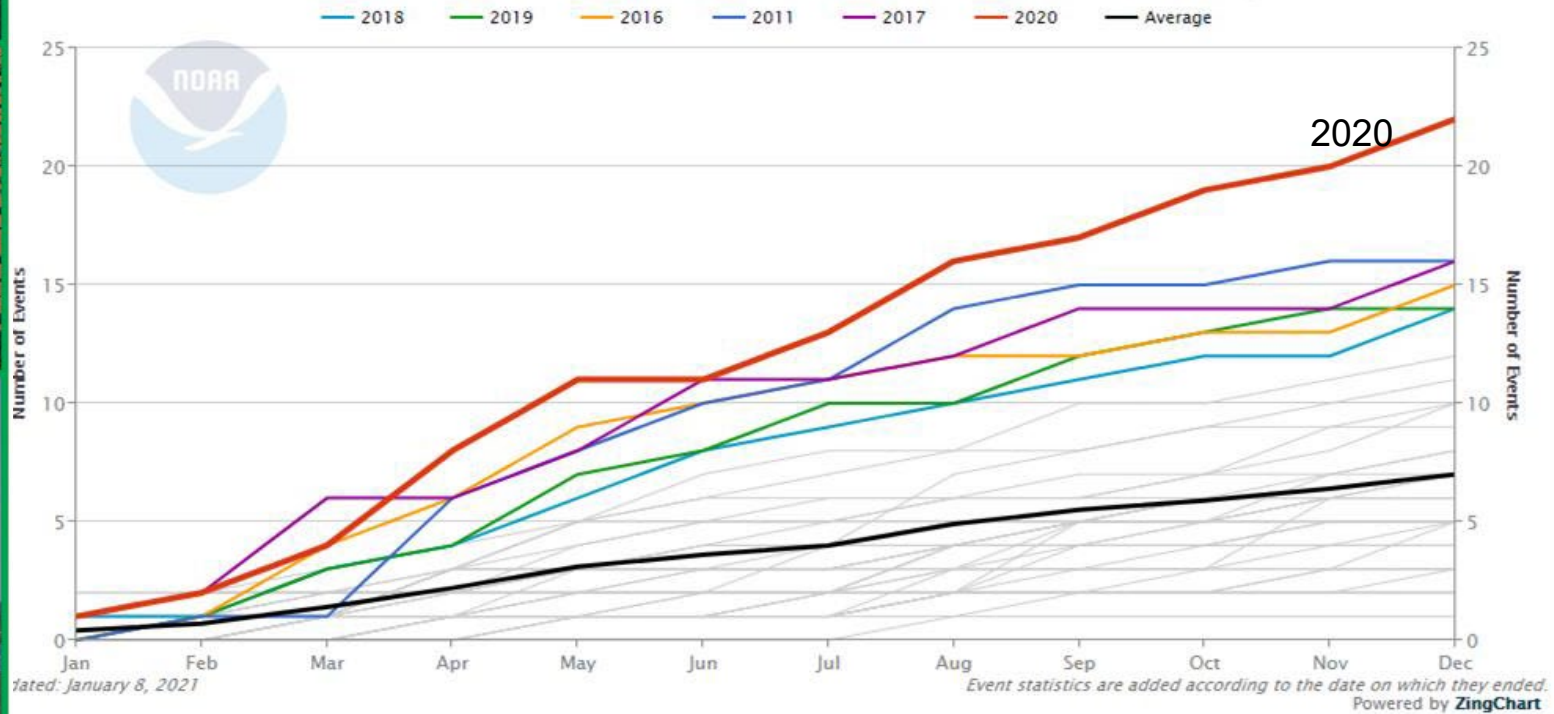

## ENSURING RESOURCE AVAILABILITY

Advanced technology, including many types of Earth information, will unlock up to **\$1.6 trillion** in economic savings for energy generation and use by 2035.

Satellite observations can also help ensure water availability, which is particularly important to the 20% of the world now living in areas of water scarcity.

NOAA'S Earth observations support weather forecasts valued at \$315 billion to the nation's economy, protecting and improving weather-vulnerable industries such as farming, shipping, and utilities.

1980–2020 Year-to-Date United States Billion-Dollar Disaster Event Count (CPI-Adjusted)

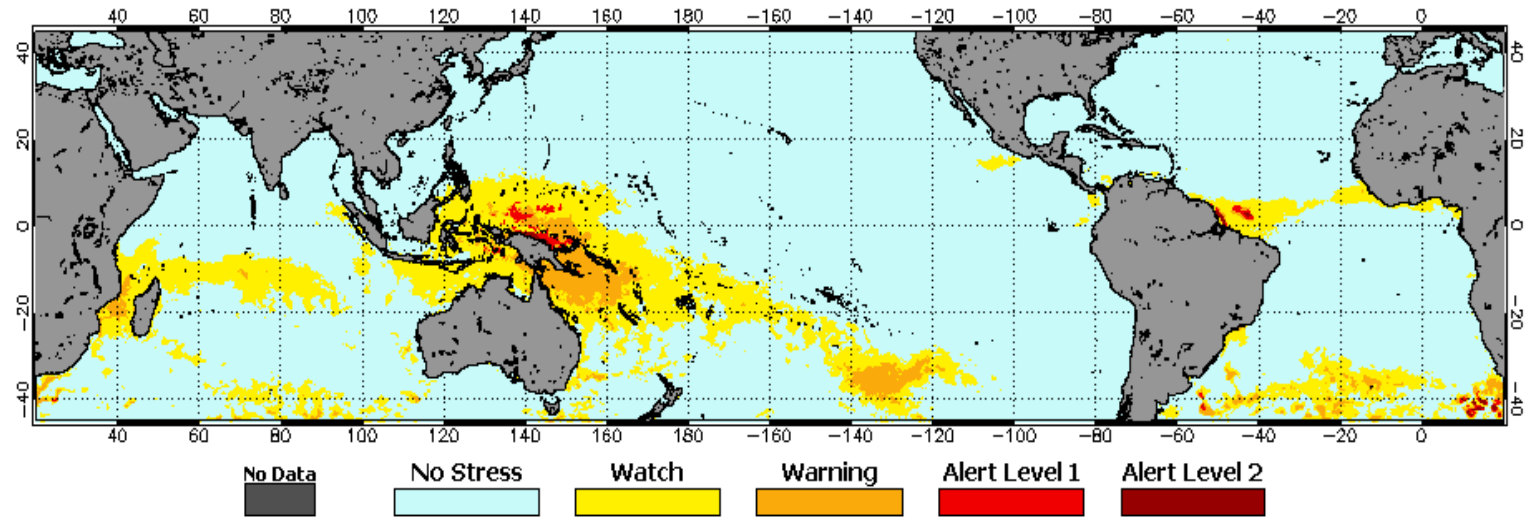

# Crisis Response and Economic Recovery

**Bottom right:** Fog at San Francisco International Airport, March 2017

NOAA Coral Reef Watch Daily 5km Bleaching Alert Area 7d Max (Version 3.1) 27 Dec 2020

## Our aspiration

Provide a truly integrated digital understanding of our earth environment that can evolve quickly to meet changing user expectations by leveraging our own capabilities and partnerships

**NESDIS**  
*Reimagined*

# NEEDS & OPPORTUNITIES: NOAA's Evolution away from "Two Orbits, One Mission"

Old Paradigm of "Two Orbits, One Mission"  
Originated in 1970's, continued through 2016

Demand and Opportunity Shaping an Earth Observation Architecture for 2030-2050 Epoch:

Intensifying demand for **timelier and more accurate extreme weather predictions**, delivered in faster, user-friendly ways as climate changes.

Increasing value in environmental assessments and projections to inform long-term **land-use, infrastructure and commercial** investments.

Rapid rise in **launch & remote-sensing capability** of U.S. aerospace industry and strategic partners.

Accelerating **innovation in ground systems**: AI, quantum computing, data science, modeling.

Commercial

**A** First in-space operation of Mirror-SAR concept: Companions act passively as a mirror for actively transmitted SAR pulses from main satellite

**B** SAR signal transferred via an innovative HF based Inter-Satellite Link

**C** Signal processing as well as downlink of SAR data done by main satellite yielding full exploitation of main satellite hardware

**D** Small-satellite platforms are used as host for SAR payloads on companions

**AIRBUS**

**SPACEX**

# NOAA's Next-Gen Earth Observation Strategy

## Integrated, Adaptable, and Affordable: Orbits, Instruments & Systems

### LEO

Miniaturized instruments on small, lower cost, and proliferated satellites and partner data improving forecasts through better and additional data. Better precipitation forecasts, wave height predictions, ocean currents, and more.

### GEO

Continuous real-time observations supporting warnings and watches of severe weather and hour-by-hour changes. High-inclination orbits to observe northern latitude & polar regions.

### Space Weather

Reliably monitoring coronal mass ejections from L1, GEO, and LEO can protect the nation's valuable, vulnerable infrastructure. New capabilities at L5 and high earth orbit can provide additional insight and improve forecasts.

### Common Ground Services

Secure ingest of data in different formats from different partners requires a flexible, scalable platform. Common Services approach integrates cloud, AI, and machine-learning capabilities to verify, calibrate, and fuse data into new and better products and services.

# Geostationary – GEO – Portfolio

# Broaden Your Perspective

9 Feb 2020: Himawari-8, GOES-17, GOES-16, Meteosat-11 (CIMSS/SSEC)

# GEO-XO User Engagement in 2020-2021

NOAA is going directly into the user community to fully understand their current and evolving needs. We do this through a variety of means, as demonstrated with our 2020-2021 GEO-XO User Engagement effort.

## User Needs Virtual Workshops

- Topics of **Fire** (178 attendees), **Weather** (233), **Agriculture** (152), **Health** (207), **Oceans** (142)
- Federal: NASA, USGS, and 20 other federal agencies
- State/Local: 26 States, multiple cities, and several counties and tribal areas
- International: WMO, Canada, Mexico, EUMETSAT, Caribbean/South American orgs
- Industry: more than 70 companies and advocacy groups from weather, transportation, communications, media, aerospace, natural resource and energy sectors
- Academia: more than 60 universities

## Community Meeting on NOAA Satellites

- 1013 participants representing 33 countries
- >250 organizations including Federal Agencies, international meteorological organizations, academia, and industry
- NASA, JAXA, ESA, EUMETSAT, JMA, KARI, Copernicus

## Listening Sessions, Panels, and Presentations

- National Weather Association
- American Meteorological Society
- American Geophysical Union

# Continuity & Enhancement of NOAA's Observing System in GEO

- In addition to ensuring continuity of today's 24/7 now-casting, GEO-XO advances NOAA's observational capabilities to meet mission requirements and supports World Meteorological Organization's vision for 2040
- GEO-XO observations will provide a comprehensive understanding of the atmosphere, oceans, and weather through 2050, including potential new capabilities (depending on budget):
  - **Improved nighttime monitoring of severe weather and hazards** with a Day/Night Imager
  - **Better forecasts with improved numerical weather prediction and nowcasting** with IR Sounder
  - **Reduced health impacts from poor air quality** with Atmospheric Composition Instrument
  - **Enhanced monitoring of ocean health and productivity** with Ocean Color Instrument

# NESDIS LEO Approach: Mission Concepts to Augment Global Measurement Capability

- Launch satellites more frequently to **enhance refresh and augment global observations collected from earth observation satellites**, beginning in mid-2020s
- Replenish **critical sounding data**
- NESDIS completed its LEO SounderSat Milestone-0 Review March 10, 2021

Vertically integrated smoke plot showing HRRR-Smoke forecast on August 20, 2020 valid at 20:00 UTC. The High Resolution Rapid Refresh Smoke model uses a suite of fire products from JPSS satellites.

- Capture **3D winds, ocean surface vector winds, precipitation data, and low-light imagery**
- **Hybrid approach:** data from NOAA satellites, strategic partners, and commercial providers

# Near Term Focus in LEO is on Innovation

In FY 2022, LEO will:

- Complete a Commercial Ground Services Demonstration (JPSS)
- Continue the detailed concept development of the SounderSat Project and the LEO program, including:
  - Milestone 1 for the LEO Program
  - The Mission Concept Review for the SounderSat project
  - The Mission Concept Review for the LEO program

# Space Weather – SWO – Portfolio

# Space Weather Observations Program

The Space Weather Program will need a comprehensive observational capability for several orbital regimes.

Thermospheric and ionospheric objectives will require in situ measurements from LEO as well as imaging capabilities from GEO.

For the magnetosphere, in situ measurements from GEO and HEO can be combined with auroral imaging.

Coronal and photospheric imagery from L1 and L5 can be used for stereoscopic analysis. In situ plasma/field data will drive heliospheric models.

# Space Weather Measurements

NOAA measures space weather from NOAA and partner-agency satellites at LEO, GEO, and Lagrange-1 orbits.

Representative missions:

- GOES-R for solar EUV and X-ray irradiance and coronal imagery
- DSCOVR, ACE, and SWFO-L1 for solar wind and interplanetary magnetic field
- GOES-R for magnetospheric particles and magnetic field
- COSMIC-2 for ionospheric electron density and particle flux

Region	Alerts and Warnings	Forecasts
Solar	EUV and X-ray irradiance (1 min)	Photospheric and coronal imagery; magnetic field (GEO or L1; 1-3 days). Sunspot number (months-years)
Heliosphere	Solar wind and magnetic field (L1; 15 min) Solar energetic particles (5 min)	Solar wind and magnetic field (L1; 27 days)
Magnetosphere	Energetic particles; magnetic field (GEO; 1 hour)	Energetic particles (GEO; 2 days)
Ionosphere	Electron density (LEO; 1 min) Particle flux (MetOp; 1 min)	TBD

**Representative current measurements from the Program of Record 2025. Objectives are identified using mainly SPRWG terminology.**

# Budget & Implementation

# NSOSA and Scoping the Future Mission Capabilities and Resource Requirements

These systems can provide our whole earth integrated observing & information system.

The Systems we are planning in this space include enhanced Geostationary, additional Space Weather, disaggregated LEO, utilization of numerous additional research and partner data, and whole earth system data access and interoperability

## Programmatic Attributes

### Flexibility

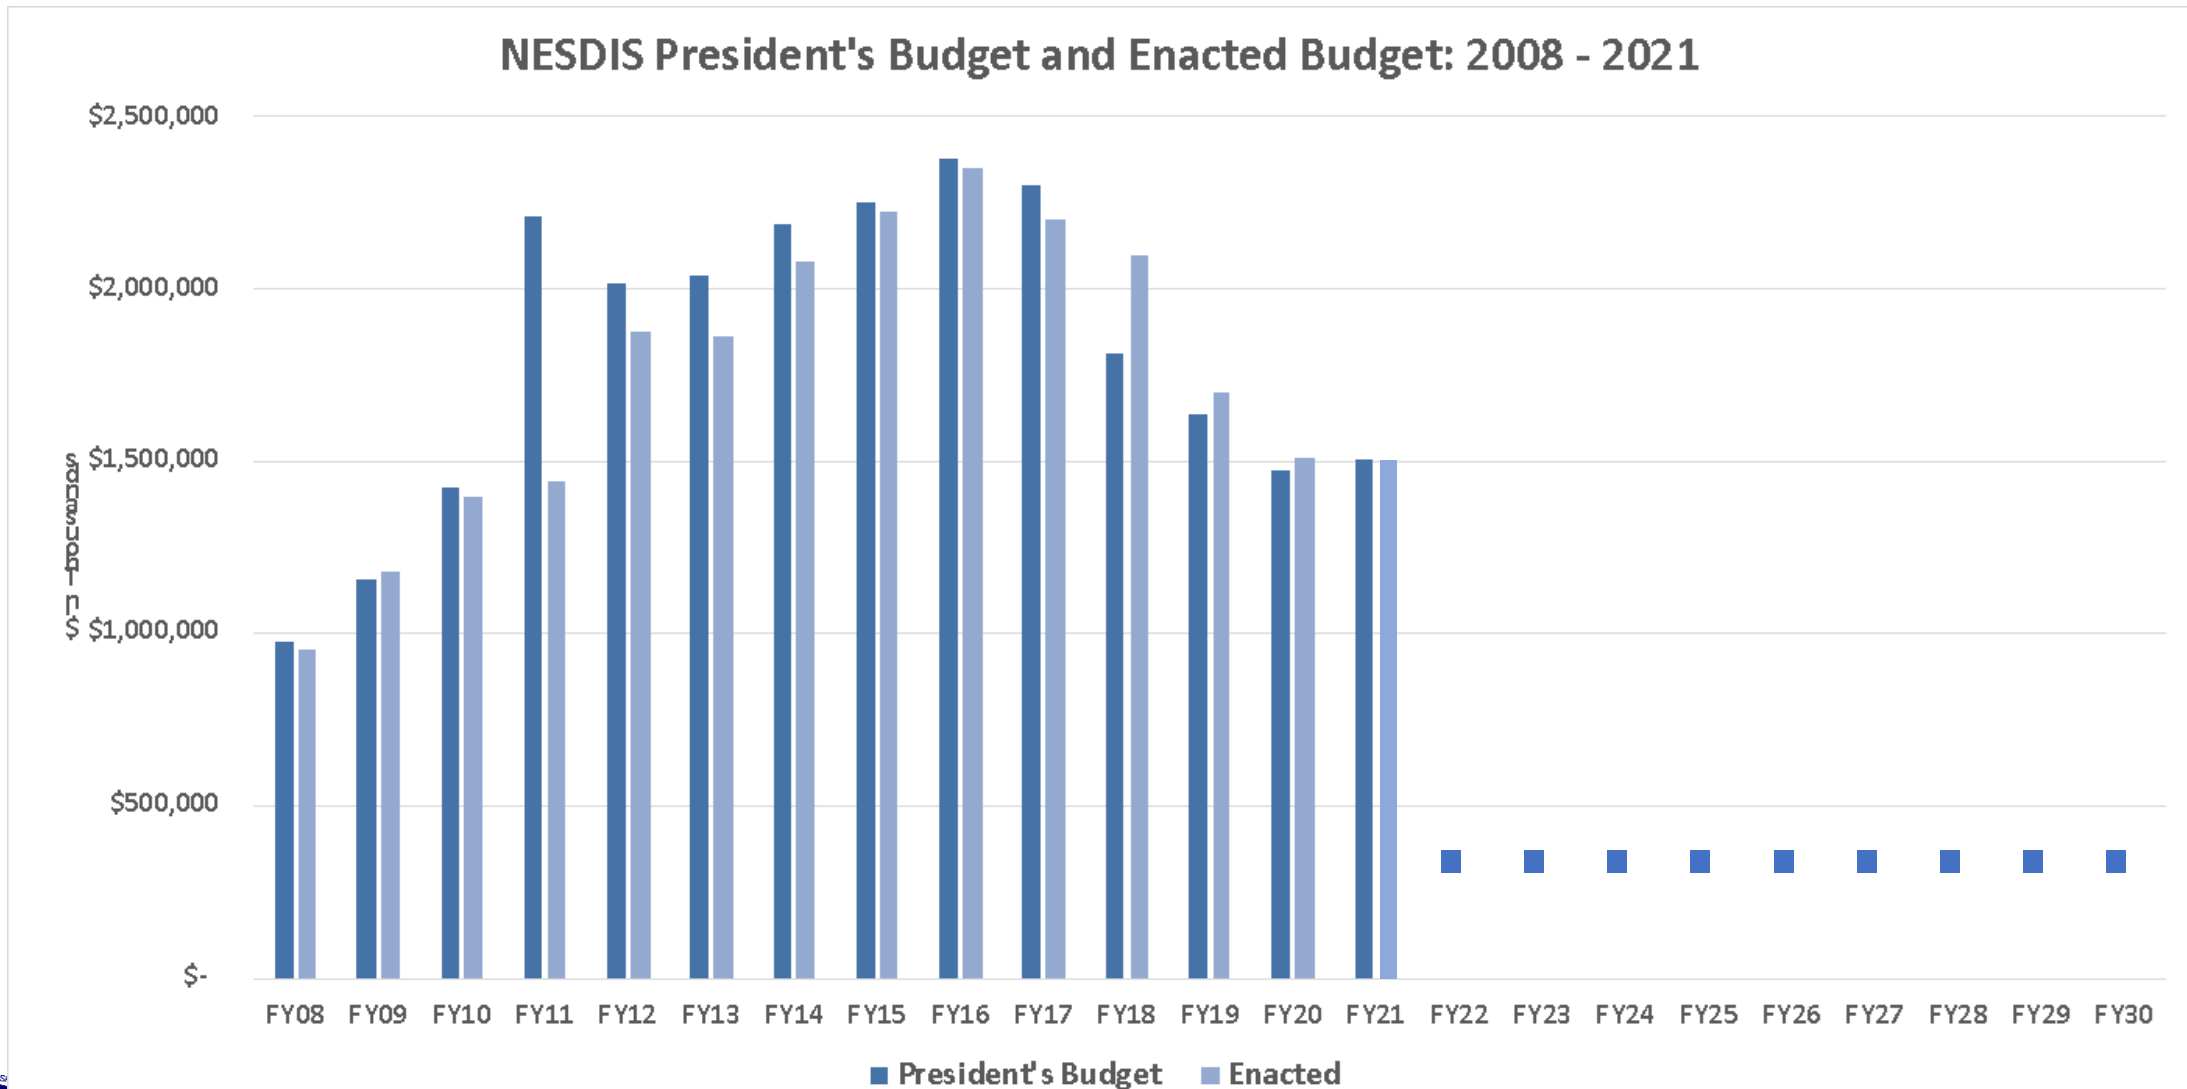

- Our Portfolios (GEO, LEO, SWO) allows us to manage risk across the different elements of each
- Creation of wedges in Common Services enables more rapid partner data exploitation

### Requirements and User Engagement

- Refresh mission requirements to intentionally include whole earth system observations – ocean, biosystems.
