

How do you use systematic reviews in your work?

SRs form the evidence base for our reports and provide inputs for our economic models

What most often limits the usefulness of systematic reviews for you?

- Staleness of the SR
- Missing outcomes
- Missing subgroups
- Missing statistics

If the standards were updated with end users in mind, what is one change that would most improve usability for your context?

I think it is difficult for systematic reviewers to anticipate use cases. Continuous updates would be valuable.
