

Finding What Works in Health Care: Updating Standards for Systematic Reviews

AI Use Across the Systematic Review Workflow: Additional Considerations for Appropriate AI Use in Systematic Reviews

May 1, 2026

Gaelen P. Adam is a senior research scientist in Brown University's Center for Evidence Synthesis in Health (CESH) in Providence, Rhode Island. She has a MLIS from Simmons, and an MPH and PhD in Health Policy Research from Brown. In addition to having contributed to the production of over 30 systematic reviews and clinical practice guidelines on a wide variety of clinical and public-health topics, she has done extensive research in the evaluation and implementation of machine learning and artificial intelligence to improve evidence-synthesis methods, particularly in literature identification. She is currently leading a living rapid review of AI tools for systematic reviews and is a team member on the Solace-AI project, a Wellcome Trust-funded initiative, aiming to create real-time evidence synthesis to support policy and humanitarian responses to climate-change health emergencies.

Lena Schmidt is a Research Fellow at the EPPI Centre, University College London. Her research focuses on methods development and automation of systematic reviews, evidence maps, and living evidence syntheses. Her work explores the use of natural language processing and automation for data mining and classifying research articles during the screening process.

Byron Wallace is an associate dean of research, director for the undergraduate data science program, and the Sy and Laurie Sternberg Interdisciplinary Associate Professor in the Khoury College of Computer Sciences at Northeastern University, based in Boston. Wallace's research areas include artificial intelligence, data science, machine learning, natural language processing, and information retrieval, with an emphasis on applications in health informatics. He is a member of the applied machine learning group and the Data Science and Analytics Lab at Northeastern. Before joining Northeastern, Wallace taught at Brown University and the University of Texas at Austin. Wallace develops machine learning and natural language processing methods that make synthesizing the vast biomedical evidence base more efficient. He also works on core machine learning and natural language processing methods, with his recent work delving into convolutional neural network architectures for text. Wallace has also recently been developing hybrid, interactive human-machine learning systems that aim to combine human and machine intelligence. Wallace's work has been supported by grants from the Army Research Office, the NIH, and the NSF. He won the Tufts University 2012 Outstanding Graduate Researcher award and his thesis work was recognized as The Runner Up for the 2013 ACM Special Interest Group on Knowledge Discovery and Data Mining Dissertation Award. Wallace also co-authored the winning submission for the Health Care Data Analytics Challenge at the 2015 IEEE International Conference on Healthcare Informatics.
