Advancing Maternal Health Equity and Reducing Maternal Mortality - A Virtual Workshop
The National Academies of Sciences, Engineering, Medicine
June 7th, 2021
Maternal mortality had been gradually declining before recently rising.

Note: Shifts in measurement (e.g., not all states were part of registration system prior to 1933; infant race was based on race of the child until 1980 and on race of the mother post-1980) account for some of the variation over time. Years 2007–2016 based on two-year estimates of the pregnancy-related mortality rate. Emily E. Petersen et al., "Racial/Ethnic Disparities in Pregnancy-Related Deaths — United States, 2007–2016," Morbidity and Mortality Weekly Report 68, no. 35 (Sept. 6, 2019): 762–65. Data for 2017 unavailable; data for 2018 based on official NVSS rate.

Black birthing people have been more likely to die than white mothers for 100 years.

Ratio of Black to white maternal mortality

Notes: Shifts in measurement account for some of the variation over time. For example, not all states were part of registration system prior to 1933, and infant race was based on race of the child until 1980 and then race of the mother after 1980.

Even higher education does not protect Black mothers from pregnancy-related death (U.S., 2007–16).

**Pregnancy-related mortality ratios per 100,000 births in the U.S., 2007–2016**

Maternal deaths are more common among Black mothers with a college education than they are among white mothers with less than a high school education.

A woman’s chance of dying in childbirth is twice as high in some states than in others (maternal mortality by state, U.S., 2018).

Variation in state maternal mortality rates, 2018

    - Maternal Near Miss
    - Maternal Death

Non-complicated pregnancies

Complicated pregnancies

Burden of Maternal morbidity

- Reduce quality of life
- Disability
- Precipitate worse health and socioeconomic outcomes

Burden of Maternal morbidity
Common Drivers of Maternal Mortality

Impacts of Social Determinants of Health
- Including safe affordable housing, living wage, quality education, transportation, availability of food, social connection and safety, job security

Impacts of Structural Racism
Notes: The maternal mortality ratio is defined by the World Health Organization as the death of a woman while pregnant or within 42 days of termination of pregnancy, irrespective of the duration and site of the pregnancy, from any cause related to or aggravated by the pregnancy or its management but not from accidental or incidental causes.

Data: OECD Health Data 2020, showing data for 2018 except 2017 for Switzerland and the UK; 2016 for New Zealand; 2012 for France.

Maternal care workforce

Supply of Midwives and Ob-Gyns, 2018 or Latest Year

Number of providers (head counts) per 1,000 live births*

* "Sum" (right of horizontal bars) may not reflect arithmetic sum of figures shown for Ob-Gyn and midwife providers because calculations were performed on exact figures, while the figure presents rounded figures. Data: OECD Health Data 2020, representing "practicing midwives" except: Canadian data reflect "professionally active" midwives; U.S. data reflect midwives "licensed to practice." Data for professionals "licensed to practice" tend to be higher than data for "professionally active," while numbers of "practicing" professionals tend to be the lowest. Data for 2018 except 2017 for Australia, Canada, Sweden, and 2015 for the U.S. Reflects midwifery professionals and midwifery associate professionals (ISCO-08 2222, 3222). U.S. data reflect CNM, CM, CPM; excludes noncertified ("lay") midwives. *Sum* does not reflect total maternity care workforce, since primary care physicians/family practitioners are not shown.

Policy Implications

• Maternity Care Providers
  - The U.S. has a relative undersupply of maternity care providers, especially midwives, and lacks comprehensive postpartum supports.

• Paid leave
  - Women receiving paid leave use fewer health care services compared to women with only unpaid leave

• Postpartum care
  - Expanding eligibility for Medicaid may lead to more stable postpartum coverage
Medicaid and maternal health

- **43%** of all births are covered by Medicaid
- **66%** of all births by Black mothers are covered by Medicaid

One in five women of reproductive age are enrolled in Medicaid, with even higher proportions among women of color:

The program’s coverage of family planning services, prenatal and maternity care plays a significant role in improving maternal health.

Nearly 30% of Uninsured New Mothers would be Eligible for Coverage with a 12-Month Postpartum Medicaid Extension

Among 440,000 uninsured new mothers

Comprehensive primary health care
Racial Equity in Maternal Health

Addressing Unequal Treatment

Black serving hospitals are more likely to perform worse on 12 of 15 delivery indicators and have higher severe maternal morbidity rates than white serving hospitals.

Black women are less likely to be screened postpartum for depression and access mental health treatment and less likely to receive health guidance on core maternal health concerns.

Addressing Unequal Experience

Black women compared to white women are more likely to report:

- Being treated unfairly and with disrespect by providers because of their race.
- Not having decision autonomy during labor and delivery.
- Feeling pressured to have a cesarean.

Addressing Unequal Outcomes

- Disparities in maternal mortality and morbidity.
- Even within the same hospital Black and Latina women are more likely to suffer from severe maternal morbidity than white people, regardless of insurance.

Sources:
- Laura Attanasio and Katy Kozhimannil, Patient-reported Communication Quality and Perceived Discrimination in Maternity Care, Med Care. Oct 2016.
The gap in average life expectancy between Black and white adults has existed for generations, and COVID-19 erased recent progress.

Average life expectancy at birth (years), 1980–2020

Notes: 1980–2017 data come from: United States Life Tables, National Vital Statistics Reports 68, no. 7 (June 24, 2019). Black and white data points before 2006 include Latinx/Hispanic people; starting in 2006, they represent non-Latinx/Hispanic Black and non-Latinx/Hispanic white. 2020 projections (dashed lines) appear in Andrasfay and Goldman (see below), representing the Institute for Health Metrics and Evaluation (IHME) current/medium projection (Oct. 2020).

## Community-Based Models to Improve Maternal Health Outcomes and Advance Health Equity

<table>
<thead>
<tr>
<th>Doulas</th>
<th>Midwifery Care</th>
<th>Group Prenatal Care</th>
<th>Pregnancy Medical Homes</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image1.png" alt="Doulas Icon" /></td>
<td><img src="image2.png" alt="Midwifery Care Icon" /></td>
<td><img src="image3.png" alt="Group Prenatal Care Icon" /></td>
<td><img src="image4.png" alt="Pregnancy Medical Homes Icon" /></td>
</tr>
</tbody>
</table>

### Doulas

Those at high risk for adverse birth outcomes receiving care from doulas, compared with those not receiving care from doulas, are:

- Two times less likely to experience a birth complication
- Four times less likely to have a low birthweight baby
- More likely to breastfeed
- More likely to be satisfied with their care

### Midwifery Care

Midwifery-led maternity care results in:

- Higher rates of vaginal delivery
- Lower rates of C-sections
- Significantly lower rates of preterm births and low-birthweight infants compared with other maternity models

### Group Prenatal Care

Group prenatal care demonstrates:

- Reduced rates of preterm birth (upwards of 41%), neonatal intensive care unit (NICU) admissions, low birthweight, and emergency department use during pregnancy
- Increases in breastfeeding, patient and physician satisfaction, and parental knowledge of childbirth and child-rearing

### Pregnancy Medical Homes

A medical home pilot in Texas resulted in better outcomes:

- Fewer emergency department visits, and fewer C-sections
- Pilots in Wisconsin and Texas increased likelihood of attending a postpartum visit

**North Carolina** formed a PMH model to prevent preterm births and reduce C-sections for individuals enrolled in Medicaid:

- Nearly 7 percent decrease in the low-birthweight rate among the state’s Medicaid population
COVID 19 Highlights the Need for High-Value Care

The same communities impacted by COVID19 are the same impacted by the crisis of maternal mortality and morbidity - making action more urgent.

- Invest in a diverse perinatal workforce
- Support and Strengthen Birthing Centers
- Extend postpartum Medicaid coverage to 1 year
