

# Systems Changes for Improving Maternal Nutrition During Pregnancy and Lactation Among U.S. Women

Rafael Pérez-Escamilla, PhD

Professor of Public Health

Director, Office of Public Health Practice & Global Health

Yale School of Public Health 

Nutrition During Pregnancy and Lactation:  
Exploring New Evidence  
NASEM, Washington DC, January 30, 2020

# Takeaways

- Strong socio-economic inequities exist
- Social injustice is the main cause of these inequities
- Solutions need to be based on systems thinking across the life course
  - Intentional and assertive efforts to include equity principles throughout (design to evaluation)
- Moving forward systems-oriented research and modelling is needed
  - strong emphasis on implementation science

# Strong socio-economic inequities exist: Women's Overweight/Obesity

Observed prevalence and adjusted odds and prevalence of pre-pregnancy overweight or obesity (BMI  $\geq 25$ ) among women in 31 ethnic-immigrant groups, United States, 2012–2014 (N = 10, 431, 092)

Ethnic-immigrant group	Prevalence percent	Prevalence ratio	Model 1 <sup>1</sup>			Model 2 <sup>2</sup>			Covariate-adjusted	
			OR	95% CI		OR	95% CI		Prevalence	SE
Non-Hispanic white, US-born	47.06	1.00	1.00	Reference		1.00	Reference		47.17	0.02
Non-Hispanic black, US-born	61.70	1.31*	1.81	1.81	1.82	1.84	1.83	1.85	61.66	0.05
American Indian/Alaska Native	61.69	1.31*	1.81	1.79	1.84	1.71	1.69	1.73	60.01	0.16
Mexican, US-born	58.45	1.24*	1.58	1.57	1.59	1.73	1.72	1.73	60.22	0.06

# Strong socio-economic inequities exist: Breastfeeding

**A** Ever breastfeeding by birth year and race/ethnicity

**B** Exclusive breastfeeding through 6 mo by birth year and race/ethnicity

**C** Breastfeeding continuation at 12 mo by birth year and race/ethnicity

Li et al. JAMA (2019)

% ever breastfed (2013)

% breastfed at 6 months (2013)

# Strong socio-economic inequities exist: Household Food Insecurity

Prevalence of food insecurity, 2018

Source: USDA, Economic Research Service, using data from the December 2018 Current Population Survey Food Security Supplement.

Prevalence of very low food security, 2018

Note: Prevalence of very low food security in other households with children is not reported; fewer than 10 households in the survey with this characteristic had very low food security.

### VIEWPOINT

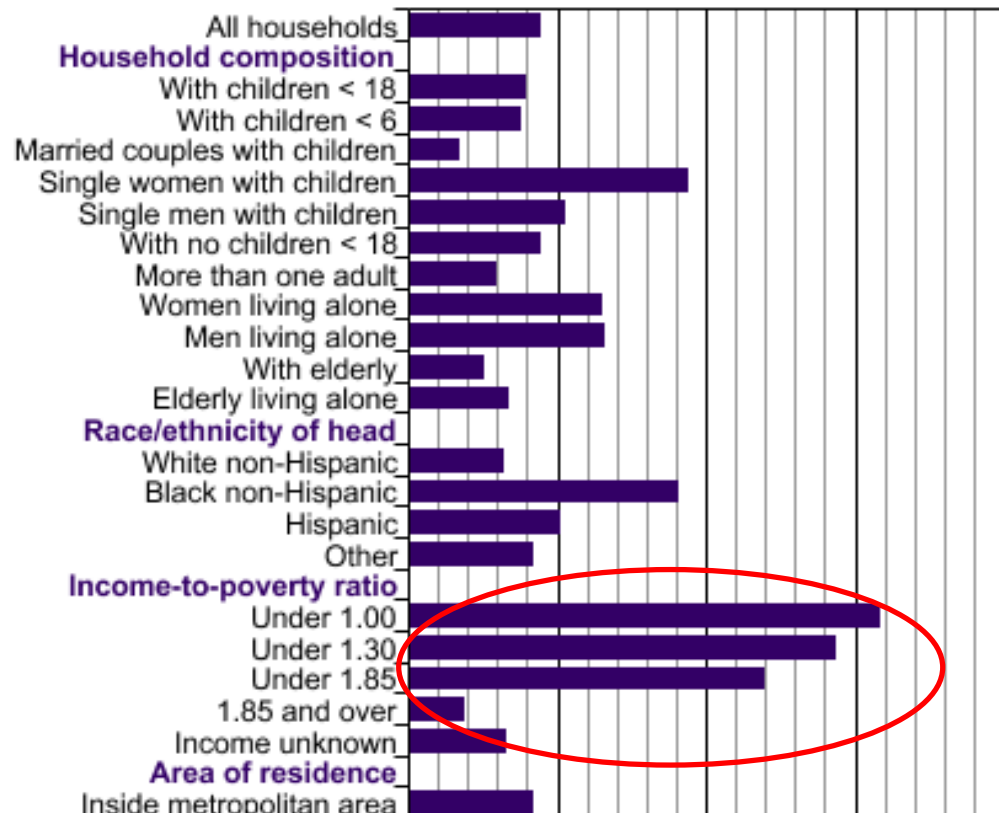

## Perinatal Origins of Cardiovascular Health Disparities Across the Life Course

JAMA Pediatrics Published online December 9, 2019

‘Racial/ethnic disparities in CVD and its risk factors may also be related to similar disparities that exist in the prevalence of preterm birth...The underlying reasons are not established [for the much higher incidence of PT birth among African American women] but may involve the **effects of chronic psychosocial stress on neuroendocrine, inflammatory, and epigenetic mechanisms that are related to**

## Prevalence of very low food security, 2018

Source: USDA ERS

# Solutions need to be based on life course systems thinking Embedded in socio-ecological model

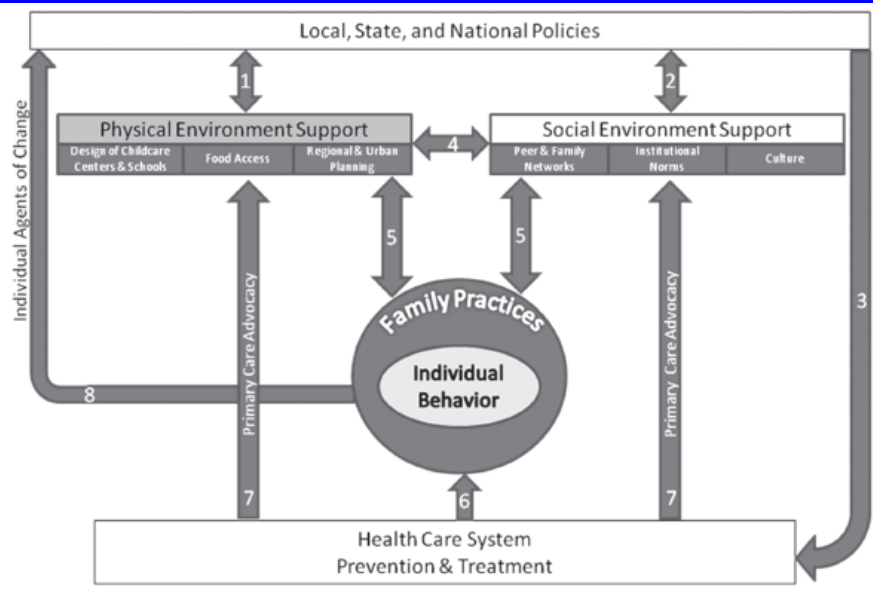

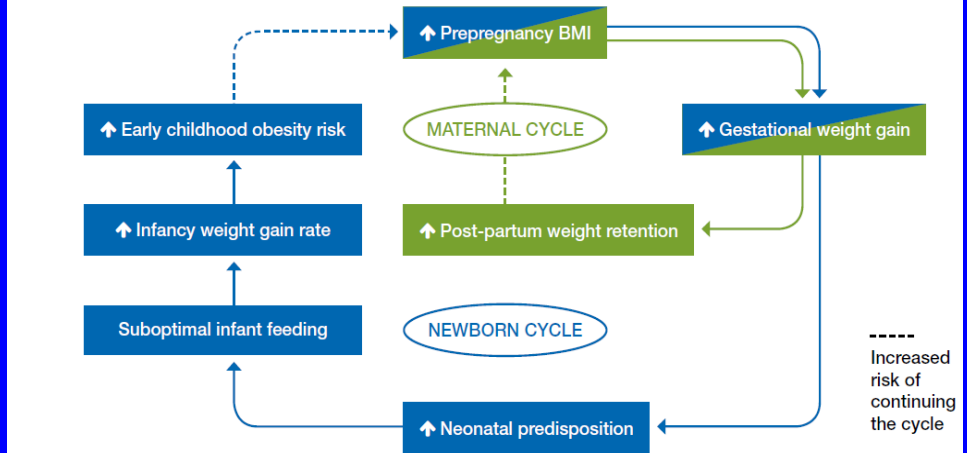

Figure 1. Maternal-child life-course obesity framework

# Community energy balance: A framework for contextualizing cultural influences on high risk of obesity in ethnic minority populations

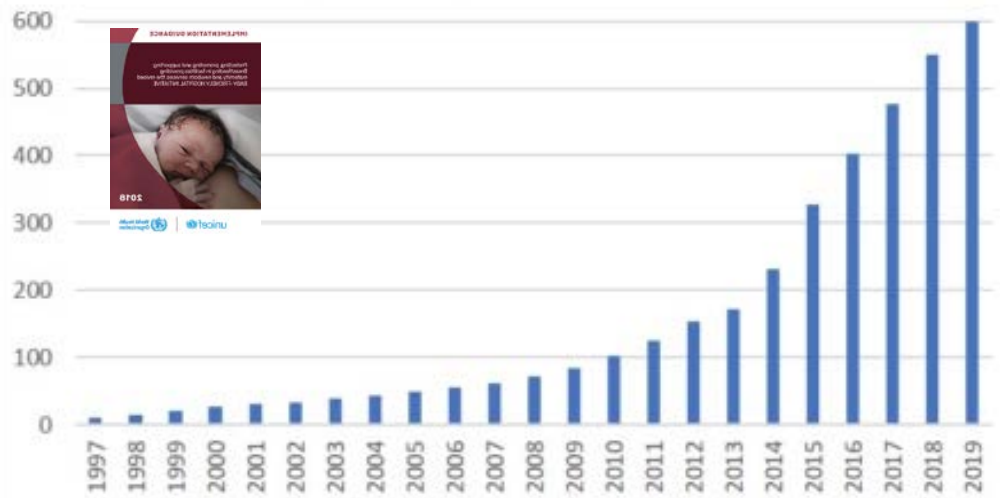

# Example 1: Breastfeeding

Table 1. Crude Breastfeeding Rates Among 167 842 Children Born From 2009 to 2015<sup>a</sup>

Variable	Year of Birth, % (SE)							Slope <sup>b</sup>	P Value for Trend <sup>b</sup>
	2009	2010	2011	2012	2013	2014	2015		
Ever breastfeeding									
Total	76.1 (0.50)	77.0 (0.51)	78.8 (0.50)	80.5 (0.48)	81.1 (0.44)	82.2 (0.44)	83.2 (0.53)	1.22	<.001
Exclusive breastfeeding through 6 mo									
Total	15.7 (0.45)	17.4 (0.48)	19.0 (0.49)	22.3 (0.53)	23.3 (0.49)	25.7 (0.53)	24.9 (0.60)	1.74	<.001
Breastfeeding continuation at 12 mo									
Total	24.6 (0.51)	25.3 (0.55)	26.8 (0.55)	29.5 (0.56)	31.3 (0.52)	34.1 (0.55)	35.9 (0.67)	2.00	<.001

Li et al. JAMA (2019)

## Baby-Friendly Facilities in the US

The Baby-Friendly Hospital Initiative (BFHI) has reached another important milestone: over 600 birthing facilities are now Baby-Friendly designated in the US, representing more than 28% of the nation's births, (Baby Friendly USA, 2020)

Health care systems approaches involving CDC, WIC, others

## BFHI reduces BF inequities

-Hospitals in Mississippi, Louisiana, Tennessee, and Texas

↑ compliance with the Ten Steps. Parallel support from community organizations

↑ BF initiation from 66% to 75% for all races combined

↑ BF initiation among AA infants from 46% to 63%

↑ EBF from 34% to 39%

↓ Disparity in BF initiation between African American and white infants by 9.6%

Merewood et al.  
Pediatrics (2019).

# Breastfeeding Gear Model

**IBFAN  
WABA**

## Example 2: Specific Policies

- Sugar sweetened beverages taxes
- SNAP incentives
- Front of package legislation
- Food product reformulation (removal of trans-fatty acids from food supply)
- Open Streets

We do not know what specific impact they have on dietary and physical activity patterns of P/L women

# Example 3: Modelling wide food system improvement

## **An Agent-Based Model of Income Inequalities in Diet in the Context of Residential Segregation** Auchincloss et al. AJPM (2011)

- A simple agent-based model was used to identify segregation patterns that generate income disparities in diet
- The capacity for household food preferences and relative pricing of healthy foods to overcome or exacerbate the differential was explored
- Income differentials in diet resulted from the segregation of high-income households and healthy food stores from low-income households and unhealthy food stores
- When both income groups shared a preference for healthy foods, low-income diets improved but a disparity remained
- Both favorable preferences and relatively cheap healthy foods were necessary to overcome the differential generated by segregation

**‘Simulation modeling can be a useful tool for proposing and testing policies or interventions that will ultimately be implemented in a complex system where the consequences of multidimensional interactions are difficult to predict.’**

# Research Recommendations

- What are the optimal dietary and physical activity patterns for P/L women?
  - Nutrient requirements, cultural preferences, dietary guidelines
- How can food and physical activity systems be improved to facilitate optimal nutrition for P/L women
  - Community Based Participatory Research (*Allender et al. Obes Rev (2018)*)
  - Implementation research (*Tumilowicz et al. Curr. Dev. Nutr. (2017)*)
- What are the impacts of policies on dietary quality and physical activity of pregnant and lactating women across ethnic/racial and socio-economic groups?
  - SNAP incentives, WIC benefits changes
  - SSBs taxes, FOP legislation, open streets
- Improve modelling approaches to optimize systems level solutions to improve nutrition among P/L women taking inequities into account! (*Morshed et al. Obes Rev (2018)*; *Tracy et al. Ann Rev. Publ. Health (2018)*)
  - Predictions are as good as the data upon which they are based

# Thank you!
