

# Perspectives on autism prevalence

10<sup>th</sup> May 2024

**Dr Liz O’Nions**

**Epidemiologist | Bradford Institute for Health Research**

**Honorary Research fellow | University College London**

Remarkable research  
for healthy ageing  
THE DUNHILL MEDICAL TRUST

**Bradford Institute  
for Health Research**

- **Administrative prevalence:** rate of recorded autism diagnosis
- **Community prevalence:** true rate of autism in people in a region (e.g. England), irrespective of whether they have a diagnosis.

- Autism as a continuum
- Differences in rates of diagnosis regionally & by service across England
- Passive vs. active approaches to autism identification
- What is the community autism prevalence & does it differ by age?
- Our estimates of under-diagnosis of autism in England

- Autism as a continuum
- Differences in rates of diagnosis regionally & by service across England
- Passive vs. active approaches to autism identification
- What is the community autism prevalence & does it differ by age?
- Our estimates of under-diagnosis of autism in England

- Current diagnostic practice conceptualizes autism categorically
- Autism characteristics are on a continuum: no “natural” diagnostic cut-point
- Diagnosis is a matter of clinical consensus
- Subject to change over time & variability between centres in terms of “conversion rates”.

Abu-Akel, A., Allison, C., Baron-Cohen, S., & Heinke, D. (2019). *Molecular autism*, 10, 1-13.

- Autism as a continuum
- Differences in rates of diagnosis regionally & by service across England
- Passive vs. active approaches to autism identification
- What is the community autism prevalence & does it differ by age?
- Our estimates of under-diagnosis of autism in England

In adults

Some NHS centres twice as likely to diagnose adults as autistic, study finds

<https://www.theguardian.com/society/2024/mar/04/some-nhs-centres-twice-as-likely-to-diagnose-adults-as-autistic-study-finds>

**Landmark research suggests people have an 85% chance of positive assessment at some centres in England and 35% in others**

In adults { Some NHS centres twice as likely to diagnose adults as autistic, study finds

<https://www.theguardian.com/society/2024/mar/04/some-nhs-centres-twice-as-likely-to-diagnose-adults-as-autistic-study-finds>

**Landmark research suggests people have an 85% chance of positive assessment at some centres in England and 35% in others**

In children { Spring School Census 2017 from the National Pupil Database (NPD) in England

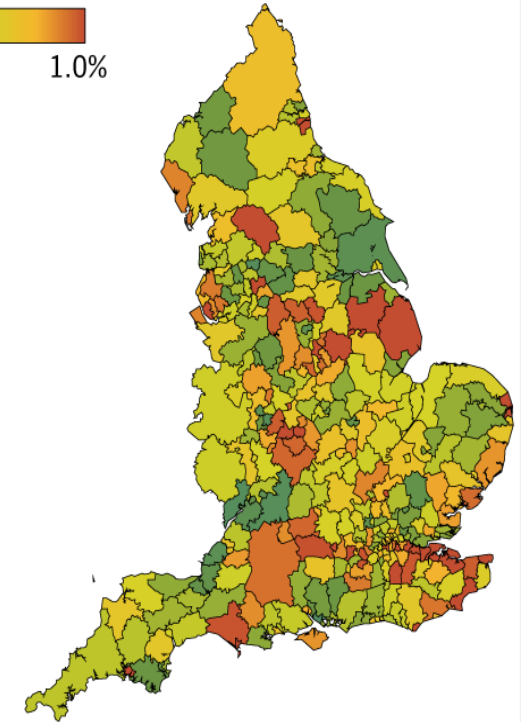

Variation in diagnosed prevalence by region among UK school pupils n = 7,047,238 (Roman-Urrestarazu et al., 2021)

<https://jamanetwork.com/journals/jamapediatrics/article-abstract/2777821>

Standardized prevalence in England for male pupils

**D** Standardized prevalence in England for female pupils

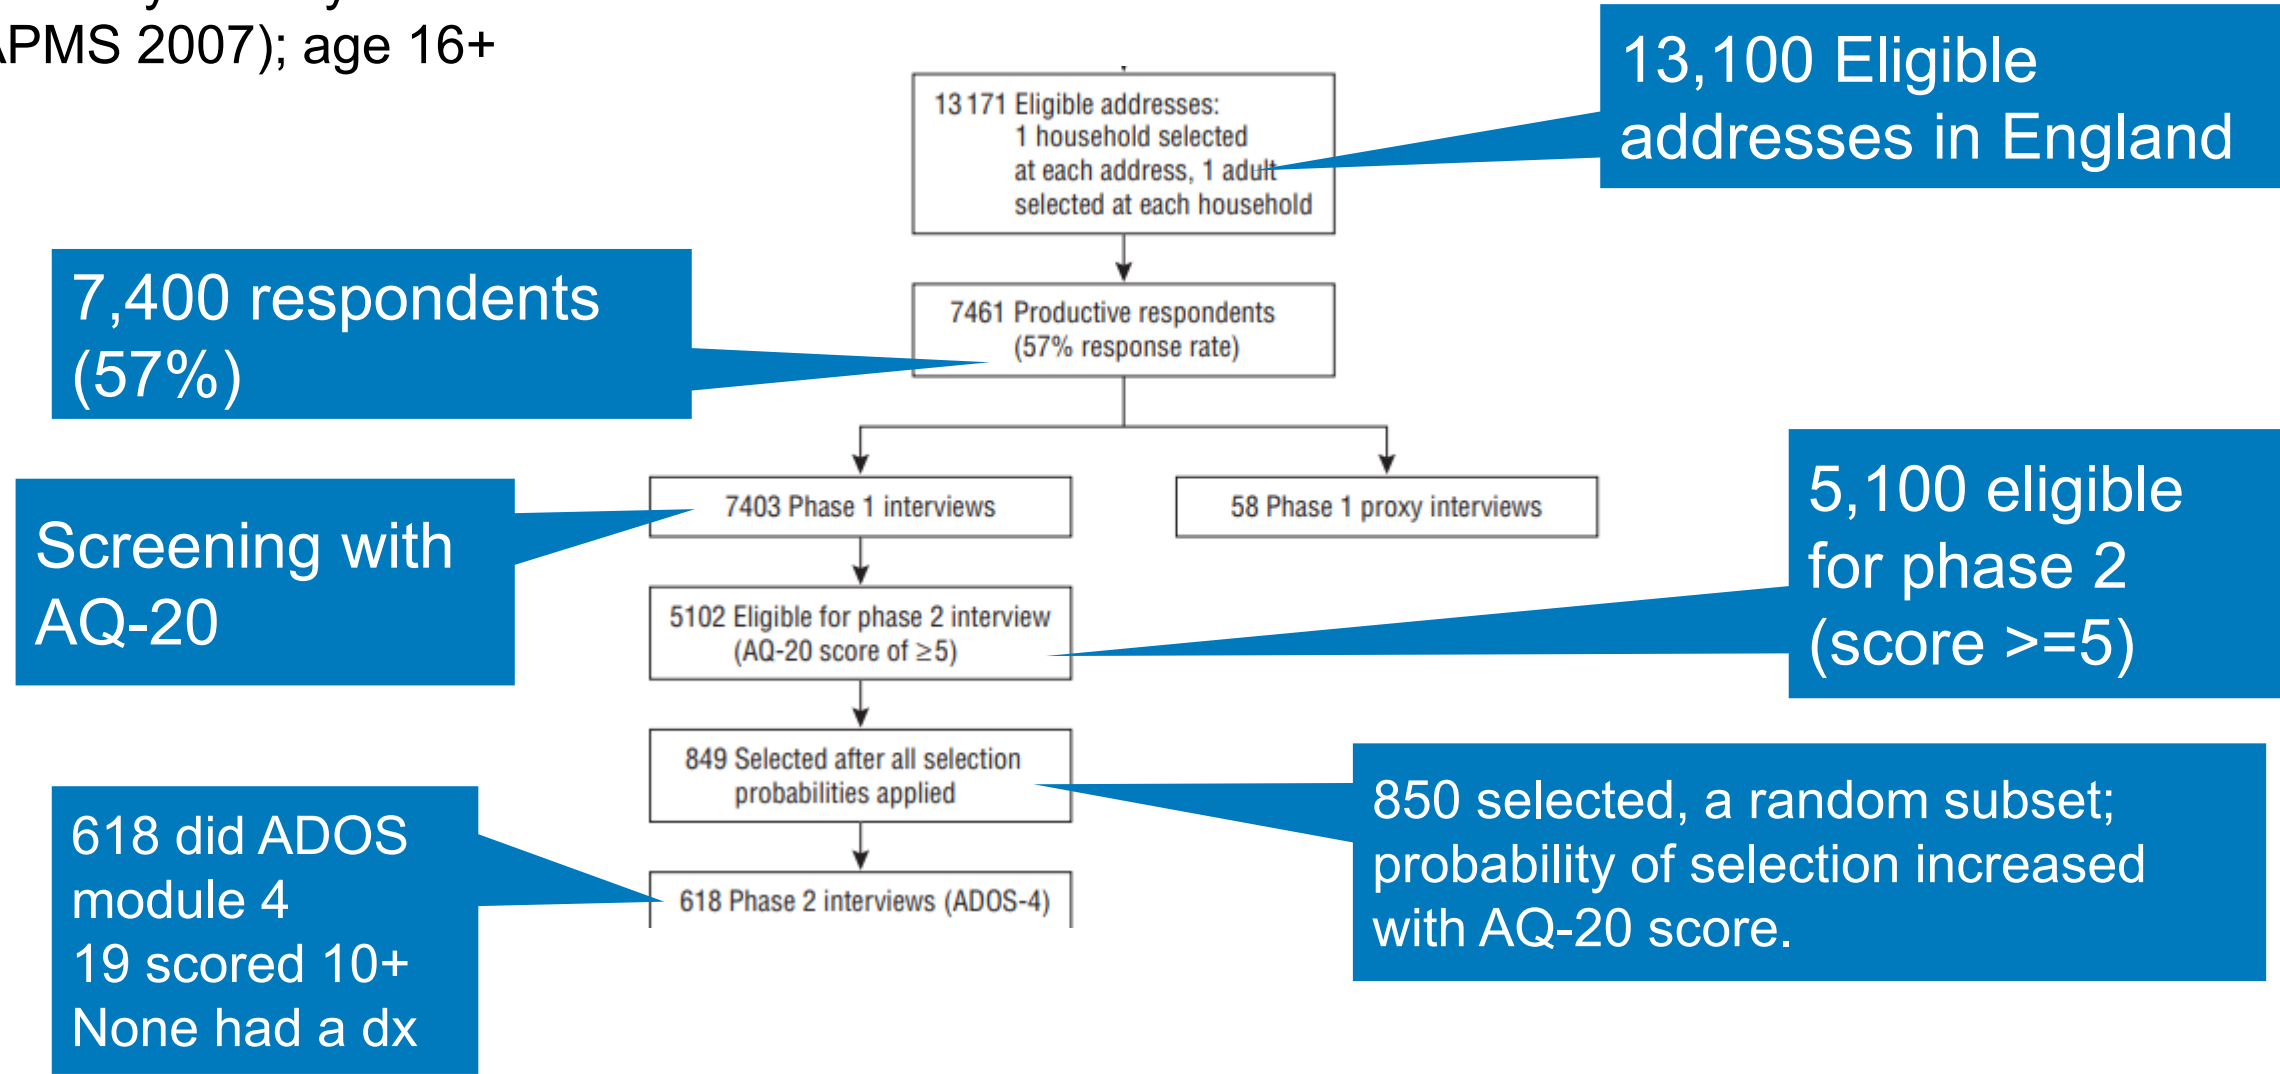

- Autism as a continuum
- Differences in rates of diagnosis regionally & by service across England
- Passive vs. active approaches to autism identification
- What is the community autism prevalence & does it differ by age?
- Our estimates of under-diagnosis of autism in England

- **Passively**, using medical/ school records to see % with a clinical diagnosis.
- But we cannot assume equal access to assessment/ diagnosis.
- **Actively**, by going out into the general population and assessing people to see what % are autistic based on assessment tools.

- Autism as a continuum
- Differences in rates of diagnosis regionally & by service across England
- Passive vs. active approaches to autism identification
- What is the community autism prevalence & does it differ by age?
- Our estimates of under-diagnosis of autism in England

Adult Psychiatric  
Morbidity Survey  
(APMS 2007); age 16+

- Results weighted to adjust for selection & non-response bias
- Estimated prevalence : 9.8 per 1000: c. 1%
- Similar to contemporary child studies (e.g. Baird et al., 2006).
- Under-identification of autistic women (9:1 ratio; 1.8% vs. 0.2%)

Table 1. Weighted Cumulative Estimates of Respondents per 1000 Population for ADOS-4 Cut-offs

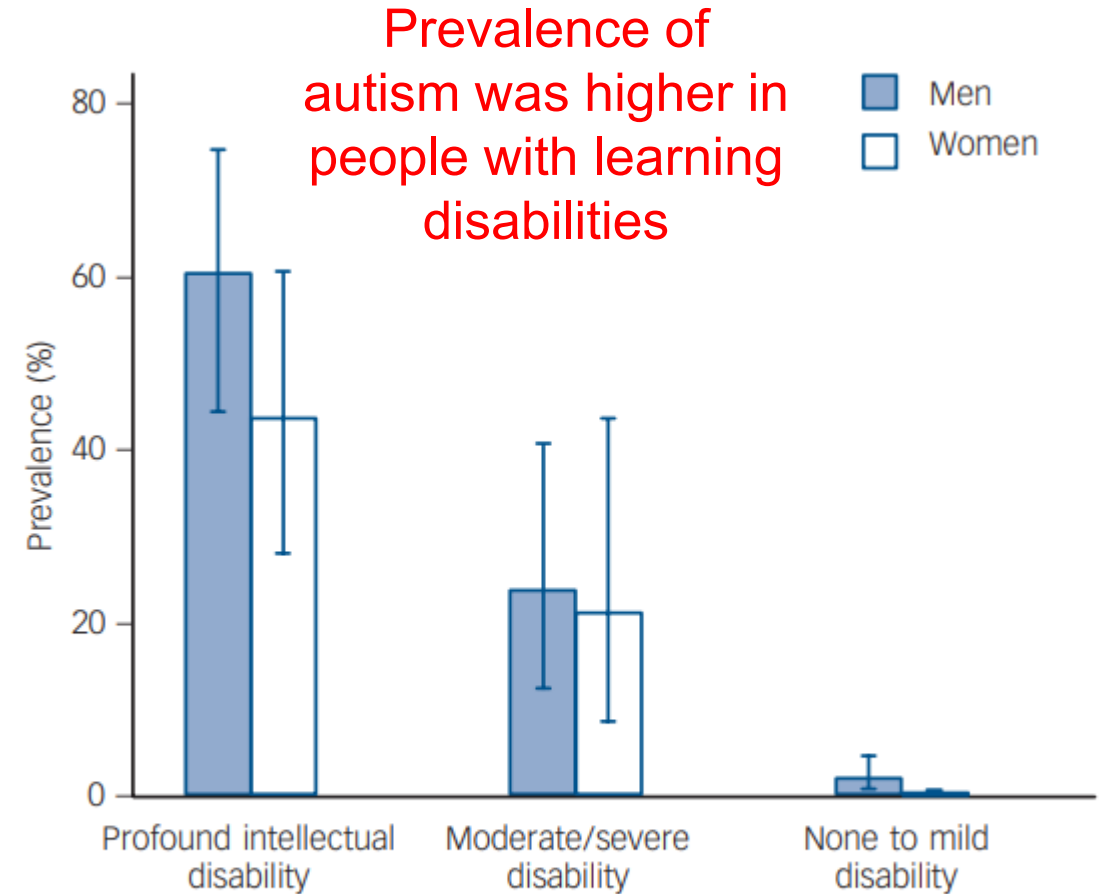

ADOS-4 Cut-off	Unweighted Base (n = 2828)	Weighted Base (n = 7333)	Weighted Estimate Rate per 1000 Population (95% CI)
≥7	32	108	14.7 (7.0-22.5)
≥8	26	88	12.0 (4.9-19.1)
≥9	20	75	10.2 (3.4-17.0)
≥10 <sup>a</sup>	19	72	9.8 (3.0-16.5)
≥11	16	65	8.9 (2.2-15.5)
≥12	12	47	6.4 (0.6-12.3)
≥13	10	44	6.0 (0.2-11.8)

1%

A less stringent ADOS-4 cut-off led to a higher prevalence

1.5%

- Previous survey only included people without moderate to profound LD
- Moderate to profound ID make up c. 0.3% of the population.
- Eligible individuals assessed in 64% of communal care establishments in a locality with ADOS (module 1).
- Including this group, estimated pooled prevalence around 1.1%

**Fig. 1** Gradient of autism prevalence by intellectual ability; combined sample.

P-value for age as a continuous predictor of being identified as autistic ( $p=.55$ ); not significant

Age trend would also be impacted by premature mortality

Suggests broadly stable true prevalence

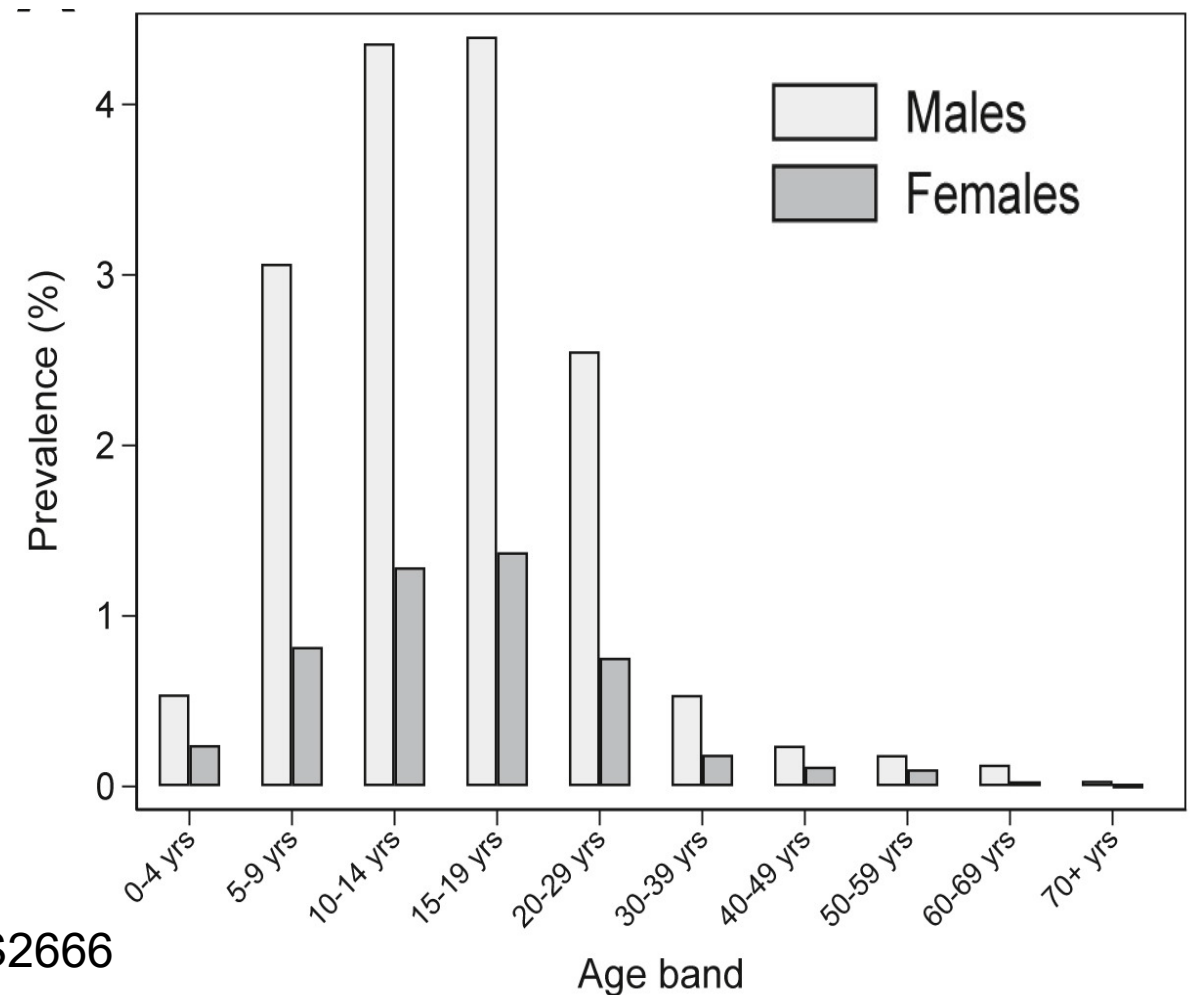

- Autism as a continuum
- Differences in rates of diagnosis regionally & by service across England
- Passive vs. active approaches to autism identification
- What is the community autism prevalence & does it differ by age?
- Our estimates of under-diagnosis of autism in England

- Stable community prevalence.
- 1% prevalence overly-conservative.
- No recent studies using up-to-date criteria.
- Children and young people (CYP) have best access to referral and assessment.
- We assume that the highest diagnosed prevalence in CYP would in fact apply to all age-groups, if there was equal access to assessment.
- c. 1% as a lower-bound; c.3% as an upper-bound figure of true prevalence.

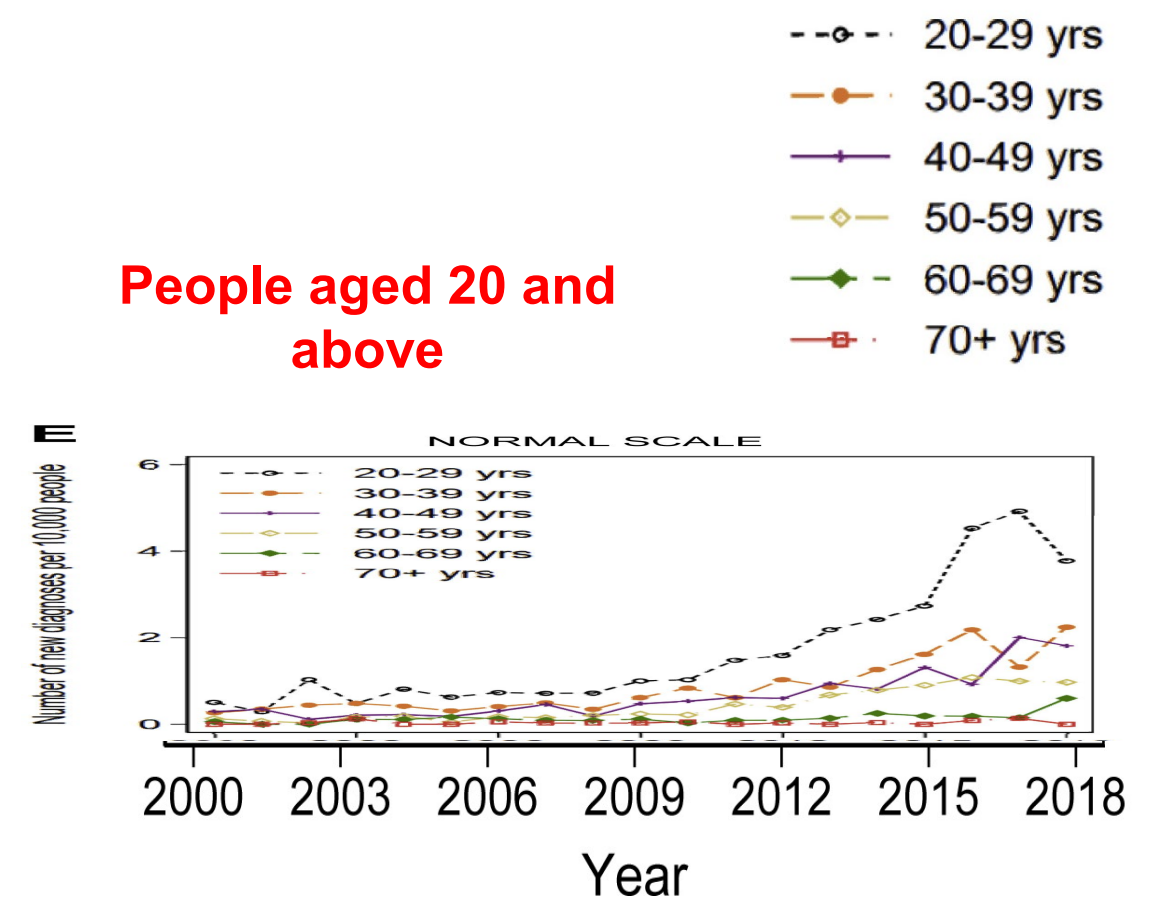

- Anonymised primary care (GP) data from 602,433 individuals in English primary care in 2018. GP data repository of health information.
- As of 2018, c.3% of 10- to 19-year-olds had a diagnosis (1 in 34).
- Highest diagnosed rate in any age-group:
  - Males without ID = 4.1% (10-14 yrs)
  - Females without ID = 1.2% (15-19 yrs)
  - Males with ID = 41.1% (15-19 yrs)
  - Females with ID = 23.7% (10-14 yrs)

% of people with an autism diagnosis as of 2018 stratified by sex

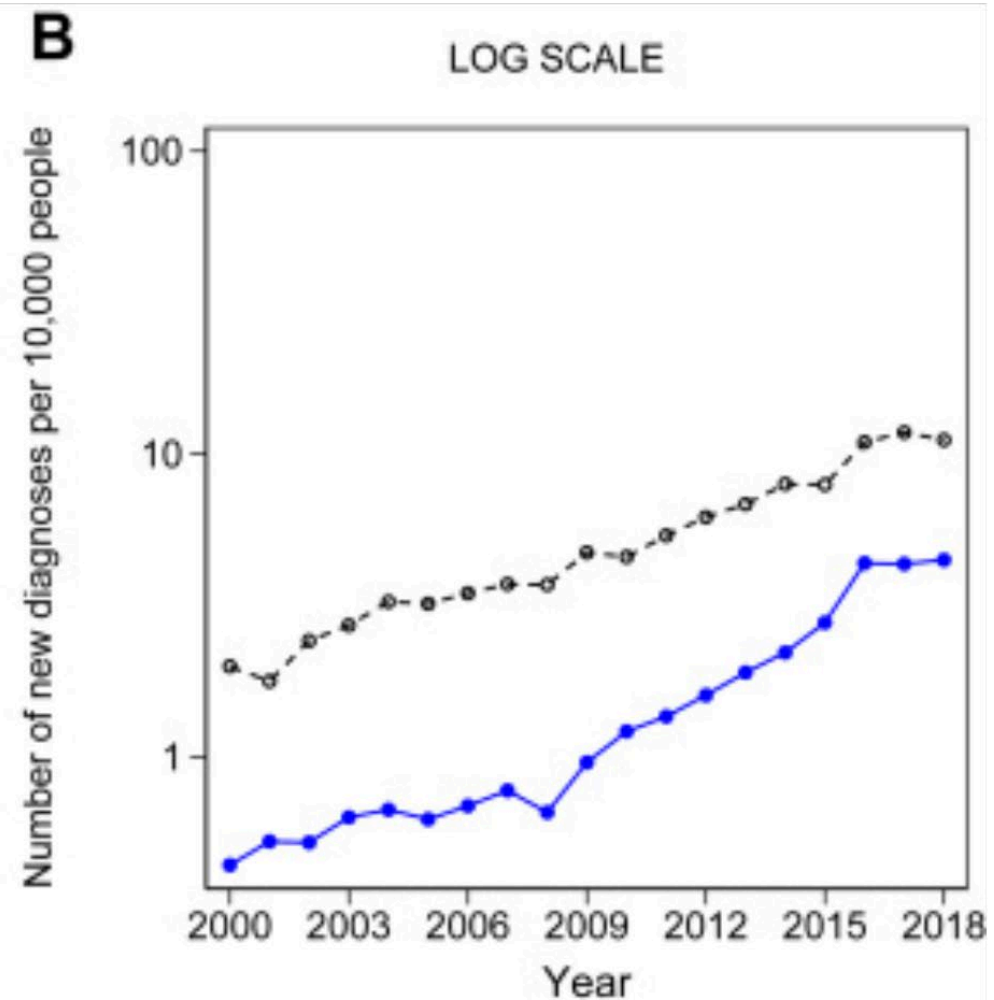

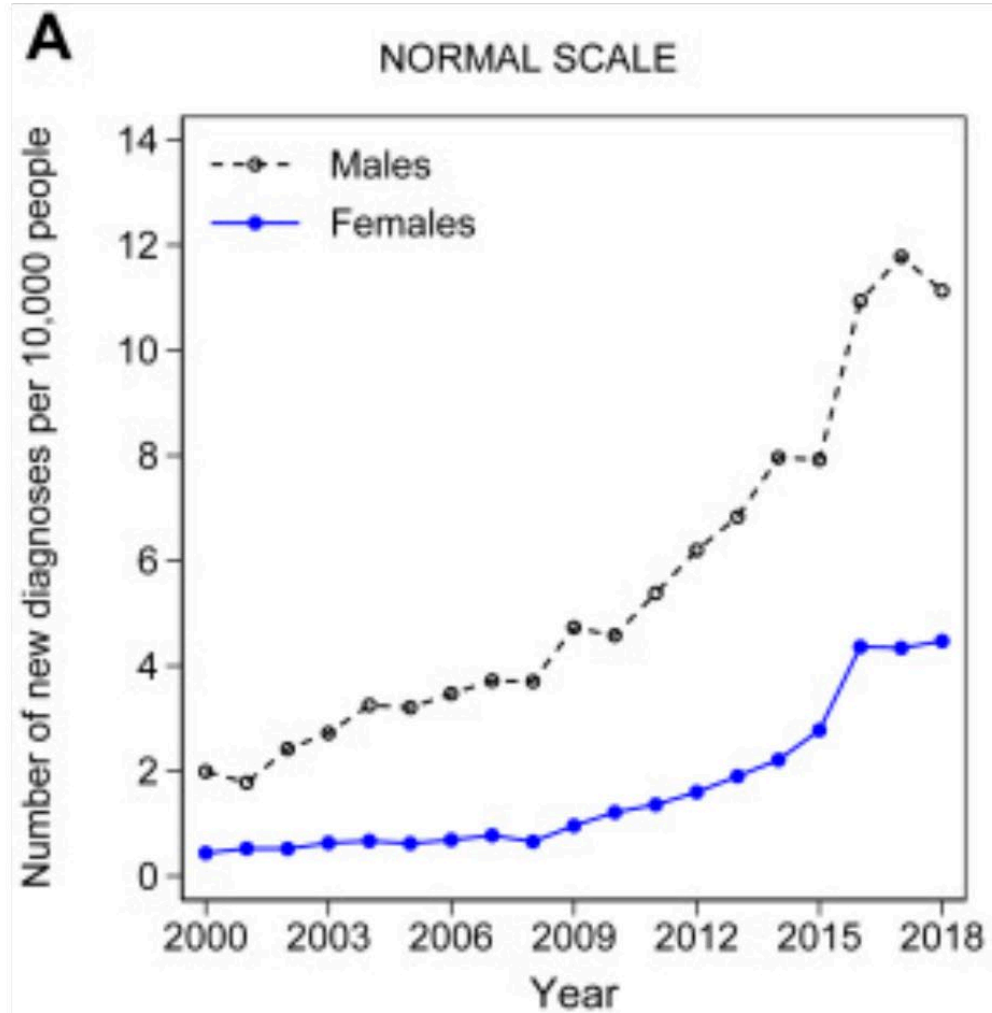

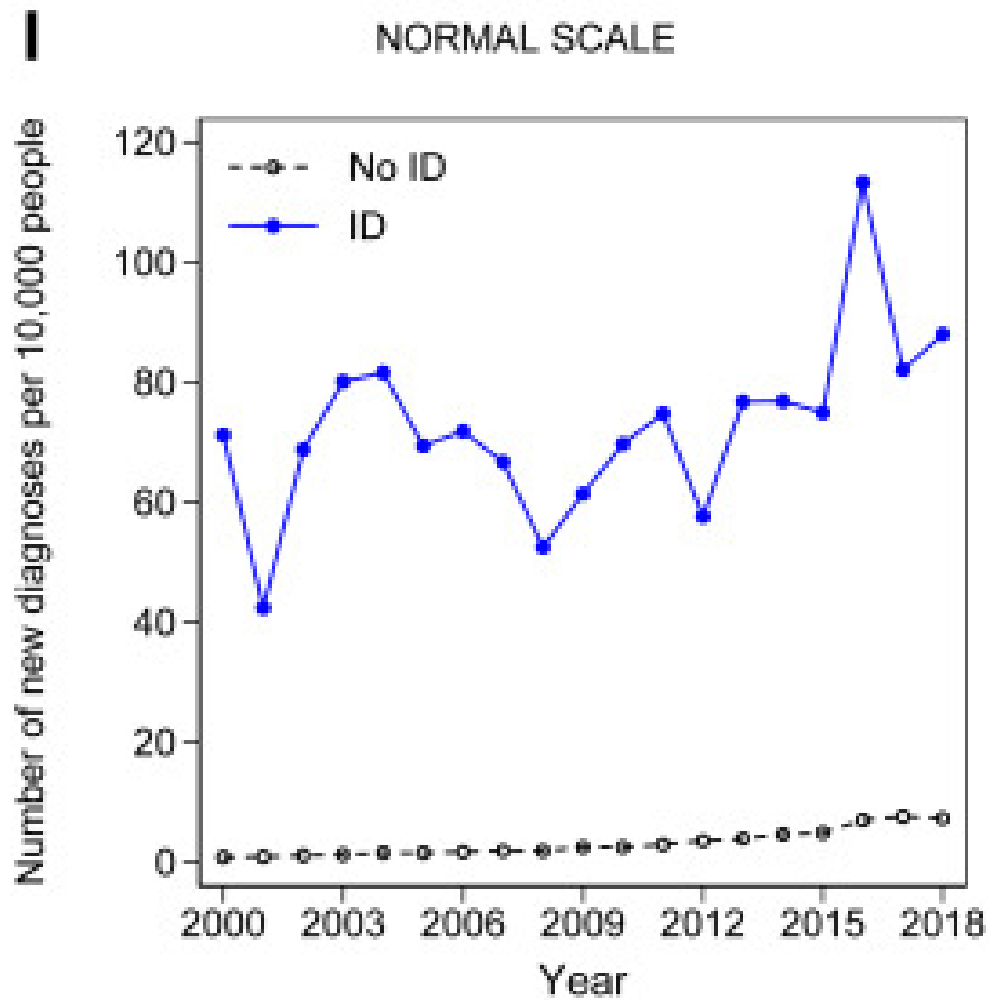

Anonymised primary care (GP) data from 5,586,100 individuals registered between 2000 and 2018 were included.

# Changes in rates of diagnosis for males vs. females: 2000 - 2018

Time trend for increase not evident in people a learning disability

- Rates of new autism diagnoses have increased dramatically between 2000 and 2018.
- Adults are much less likely to be diagnosed than children.
- There are between c. 740,000 and 1.7 million autistic people in England out of a population of 56 million.
- Even assuming a true prevalence of c. 1%, 9 out of 10 autistic over-50s are undiagnosed.
