# Optimizing the Urban Dividend

<https://www.africancentreforcities.net/>

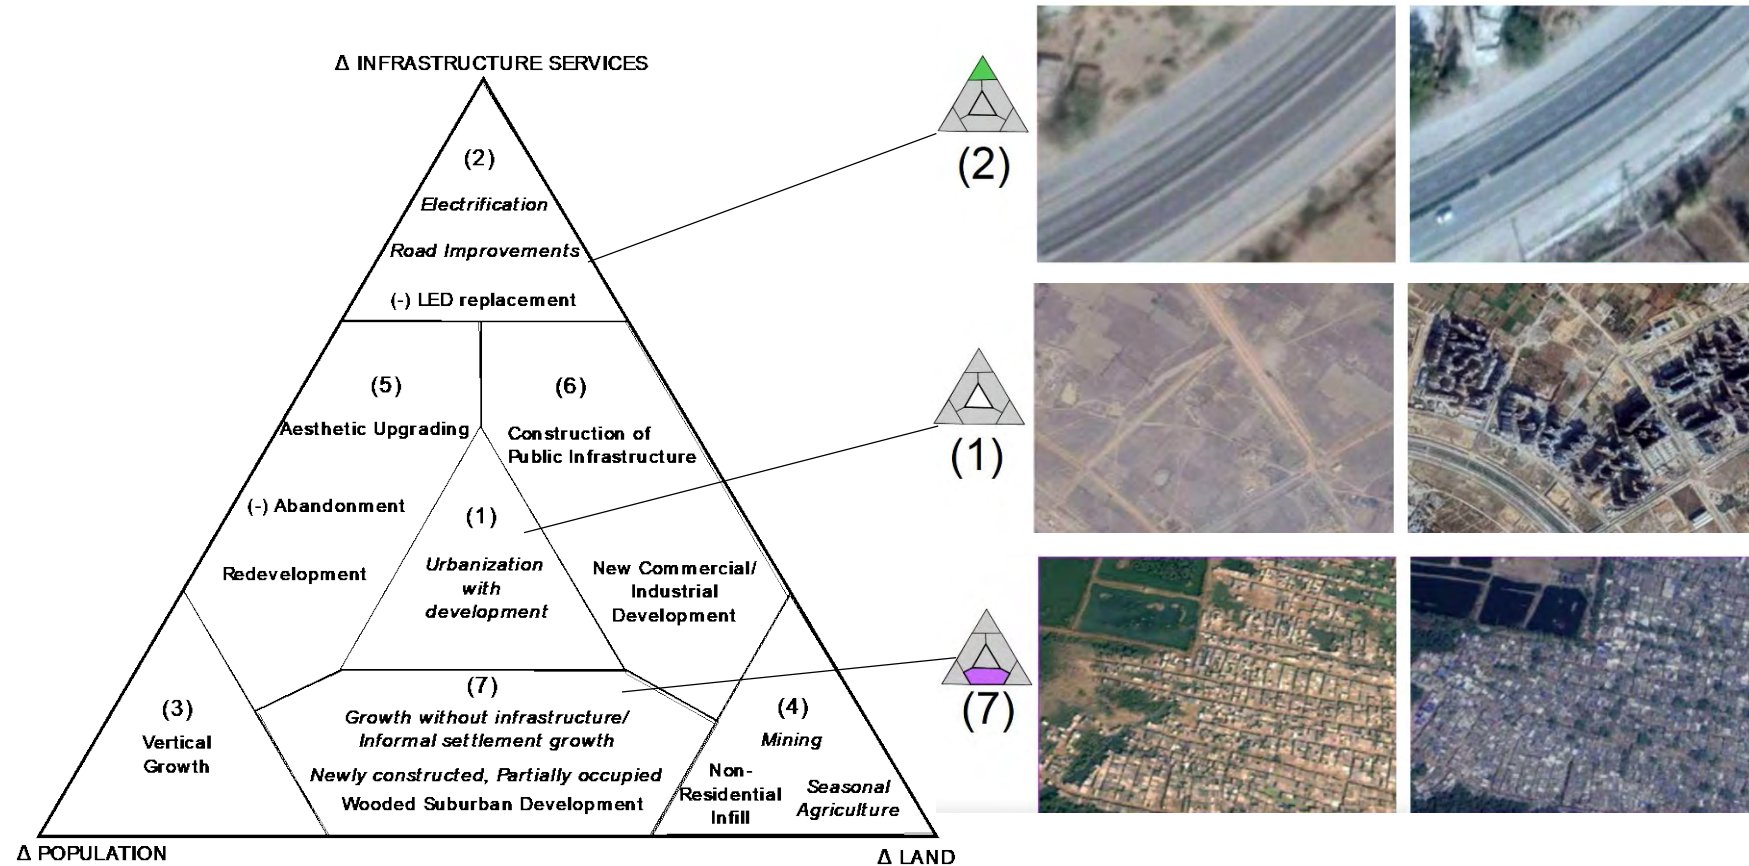

- Urbanization can present both challenges and opportunities for flooding.
- Can be defined and quantified through multiple lenses.
- Risks can propagate downstream due to new impervious surfaces.
- **Investment in “Urban 2.0” data and analytical tools is needed, specifically locally.**

# Characterizing Urban Infrastructural Transitions for the SDG's Using Multi-Temporal Land, Population, and Nighttime Light Data

Eleanor C. Stokes and Karen C. Seto, RSE, DOI:[10.1016/j.rse.2019.111430](https://doi.org/10.1016/j.rse.2019.111430)

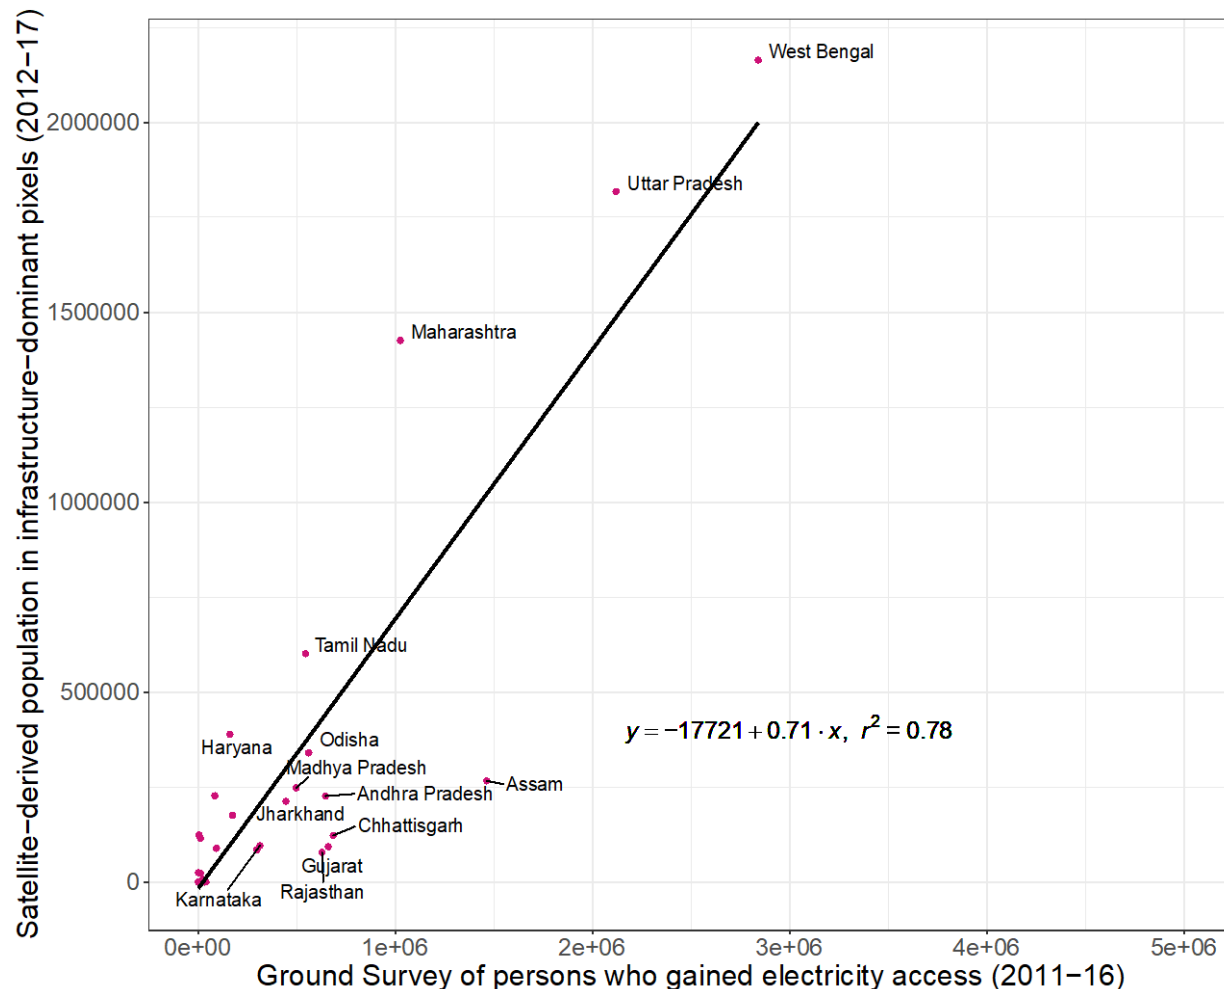

Though urbanization is often linked to development gains, some regions in Asia, Latin America, and Sub-Saharan Africa have grown in urban population, while remaining bereft of basic services like reliable electricity. Daytime optical remote sensing has tracked urban land cover change for decades, but few studies have monitored whether infrastructure is keeping pace with demographic and land transitions. This study fuses multi-temporal population and land data with nighttime lights data, derived from the Suomi-NPP VIIRS Day Night Band, classifying different types of urban development processes in India and the US.

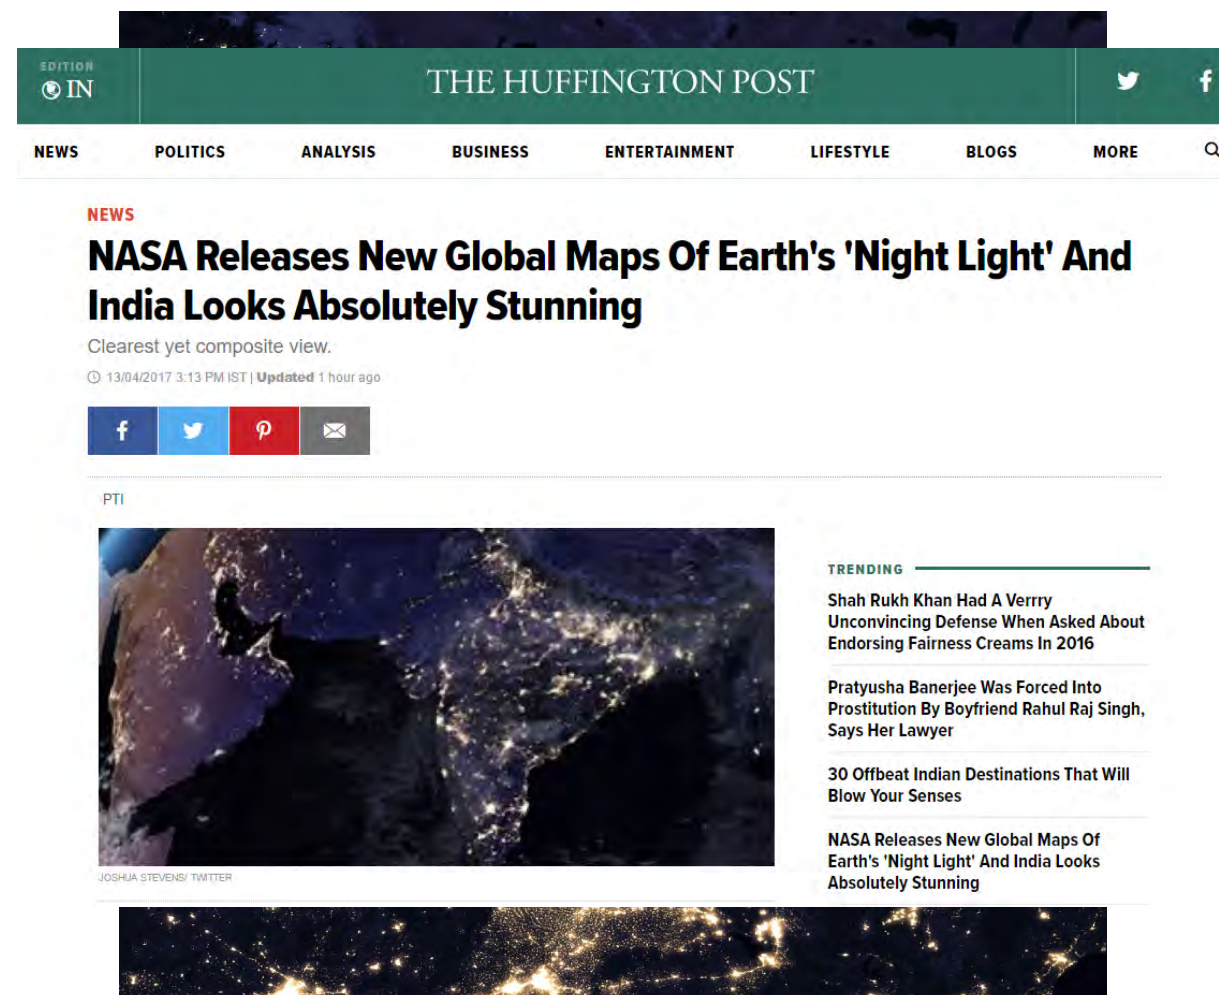

# Characterizing Urban Infrastructural Transitions for the SDG's Using Multi-Temporal Land, Population, and Nighttime Light Data

Eleanor C. Stokes and Karen C. Seto, RSE, DOI:[10.1016/j.rse.2019.111430](https://doi.org/10.1016/j.rse.2019.111430)

The new classes developed relate directly to human well-being as they describe when infrastructural transitions have kept pace with land and demographic transitions. In India, the class “electrification” tracks the national electrification projects in West Bengal and Uttar Pradesh over the past decade. Regression results above show that estimates of rural population gaining access to electricity between 2011 and 2017 based on the remote-sensing classification closely match estimates based on ground surveys.

# Socioeconomic Impact Evaluation for Near Real-Time Flood Detection in the Lower Mekong River Basin

*Hydrology* **2018**, 5(2), 23; <https://doi.org/10.3390/hydrology5020023>

Estimates of flood inundation depths were overlaid onto local land cover, population density, and infrastructure data to produce provisional estimates of persons affected and flood damages (Credit: Perry Oddo and John Bolten, NASA/GSFC)

- Populations and vulnerability are dynamic – data has trouble keeping up.
- More information needed on human scale (census) and ground truth.
- Need to contextualize data for each region to understand flood impacts.
- Research on trade networks, resource flows, and interactions needed.

# EfSI-2019 Symposium: Key Takeaways

- 1 Communication is Key
- 2 Consider Flooding as a System
- 3 Visualizations are a Powerful Tool
- 4 Find the Right Data and Apply It
- 5 Resilience through Partnerships

# Communication is Key

- The media plays a central role in influencing how people obtain, understand, and apply information about flooding.
- In a session on [Newsrooms and Data Journalism](#), panelists expounded on ways to adapt messaging according to the timescale and needs of an audience.
- A local weather forecast with updates on current road conditions may be meant for immediate consumption, whereas an article about climate change may be effective long after it's published.

IOM DISPLACEMENT  
TRACKING MATRIX

<http://www.internal-displacement.org/publications/eight-months-after-idai-chronology-of-displacement-humanitarian-needs-and-challenges>

This study aimed to support the monitoring of displacement via satellite-derived observations of night time lights (NTL) from NASA's Black Marble product suite along with an SMS-based emergency survey after cyclone Idai had made landfall in Beira (Mozambique) in March 2019. Information about anomalies in NTL has the potential to support humanitarian decision-making via estimations of people affected or the coordination of rapid response teams. We found that around 90 percent of Beira's power grid had been affected. In collaboration the [Internal Displacement Monitoring Center \(IDMC\)](https://www.idmc.org/) we used these findings to establish a framework that links NTL observations with existing humanitarian decision-making workflows to complement ground-based survey data and other satellite-derived information, such as flood or damage maps.

# Find the Right Data and Apply It

## Identifying gaps in OpenStreetMap coverage through machine learning

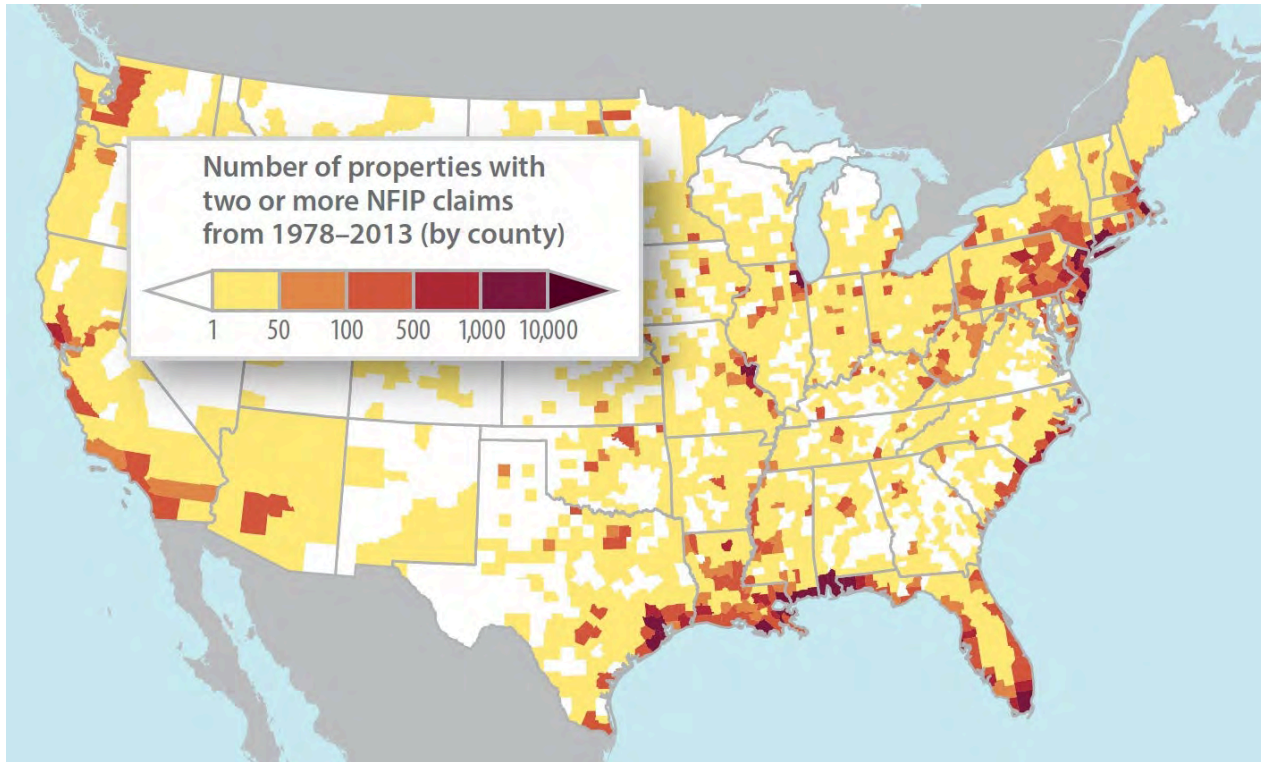

**Goal:** Use VIIRS Nighttime lights to better distinguish fully mapped areas from those where additional mapping (for example through crowd-sourcing campaigns) would pay greatest dividends.

# Address the Causes of Flood Risk, instead of the Symptoms

## Why Is It So Hard to Fix the National Flood Insurance Program?

### **‘Gross public irresponsibility’**

An unknown thousands of homes have been built and rebuilt in the floodplain across the U.S. since the creation of the National Flood Insurance Program. That is not what lawmakers originally intended.

### **From the original National Flood Insurance Program law**

Insurance may be based on workable methods of pooling risks, minimizing costs, and distributing burdens equitably among those who will be protected by flood insurance and the general public.

(e) It is the further purpose of this title to (1) encourage State and local governments to make appropriate land use adjustments to restrict the development of land which is exposed to flood damage and minimize damage caused by flood losses, (2) guide the development of proposed future construction, where practicable, away from locations which are threatened by flood hazards, (3) encourage lending and credit institutions, as a matter of national policy, to assist in furthering the objectives of the flood insurance program, (4) assure that any Federal assistance provided under the program will be related to the programs and activities of the Federal Government.

Houston Chronicle

# Address the Causes of Flood Risk, instead of the Symptoms

Remarks by Senator Chris Van Hollen (D-MD)

## \$1.4 Billion:

- 200,000 households with small rooftop PV systems.
- Reduces Puerto Rico's blackout by 173 days.
- Reduces fuel costs by \$157 million / year.

## Satellite-based assessment of electricity restoration efforts in Puerto Rico after Hurricane Maria
