Declarations: Funding Sources and Committee Memberships

<u>Travel and Speaker honoraria</u>: I have received travel cots for scientific presentations from Kerry Taste and Nutrition, Pepsico, United States Department of Agriculture, General Mills, British Physiological Society, AB Mauri, Institute for the Advancement of Food and Nutritional Science (IAFNS), GB Foods, ILSI-SEA, Institute for Food Technologists (IFT), European Federation of Food Science and Technology (EFFOST), Nestle Nutrition Institute, Ferrero (Somartec), Mondelez, The Association for Chemosensory Sciences (AChemS), European Chemosensory Research Organisation (ECRO), International Glutamate Technical Committee (IGTC), Society for the Study of Ingestive Behaviour (SSIB), Elsevier, Korean Federation for Food Science and Technology (KFFOST), the Norwegian Technology Platform, Barilla, Ajinomoto, Beijing Academy of Agriculture and Forestry Sciences (BAAFS), British Nutrition Society, World Sugar Research Organisation, and the Northern Irish Dairy Council.

<u>Committee</u>: Member of the Non-nutritive Sweeteners Committee for the Institute for the Advancement of Food and Nutritional Science (IAFNS), advisor to IAFNS on Food Processing Classification, Member of the Advisory Group to UKRI Public Consultation on UPF. Scientific Advisory Board for ILSI Europe (2026-2029), Global Scientific Advisory Committee for Lesaffre (2024-present), Scientific Advisory Board Institute for Food and Health, University College Dublin (IRL). Former member of the Kerry Health and Nutrition Institute KHNI, (2017-22).

Editor: European Journal of Nutrition (Section Editor: Nutrition Behaviour), Journal Texture Studies, Nutrition Bulletin, Journal Future Food.

<u>Funding (last 5 years)</u>: My research is funded through the Dutch Public-private partnerships scheme, TKI Top Sector Agri-Food program (TKI-Agri-Food (NL) LWV22098, TKI-Agri-Food (NL) LWV22150. Unrestricted grant support from Ajinomoto, Tate and Lyle and Somartec.

The Context; Why focus on Energy Density and Eating Rate?

'UPF consumption in observational studies is strongly associated with increased risk of obesity and obesity-related metabolic complications. Only a handful of RCT's have looked at UPF and energy intake'

Do UPF's drive passive "overeating"?

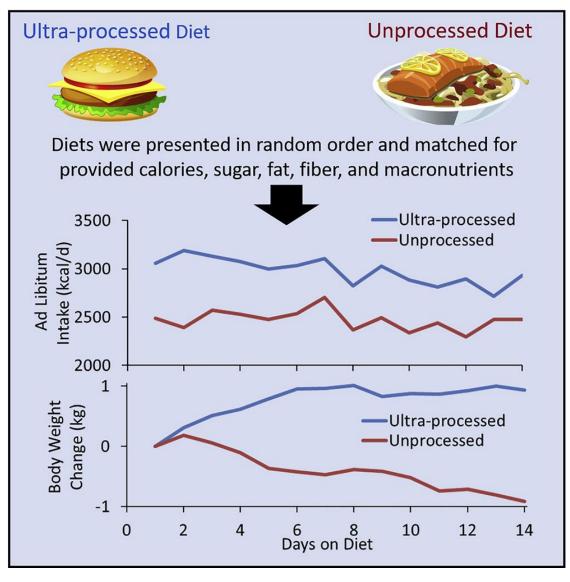

UPF RCT's: Effects on Energy Intake and/or body weight

Multiple Day (UPF vs. Minimal Processed)

Hall (2019) - Cell Metabolism Hamano (2024) - Diabetes, Obesity & Metabolism Dicken (2025) - Nature Medicine Discepoli (2025) - Journal of Clin Periodontology Preston (2025) - Cell Metabolism Santos de Oliveira (2025) - Food & Function

<u>Single days or single meals (UPF vs. Minimal Processed)</u>

Teo (2022) - American Journal of Clinical Nutrition Lasschuijt (2023) - European Journal of Nutrition Larcom (2025) - Appetite

Hall et al (2019) Cell Metabolism

Is Ultra-processing to blame or differences in energy density?

Differences in total* or solid food energy density (kcal/g)

RCTs and Energy Density

Hall (2019) - **Cell Metabolism** [94% 个 UPF arm]
Hamano (2024) - **Diabetes, Obesity & Metabolism** [55% 个 UPF]
Dicken (2025) - **Nature Medicine** [24% 个 UPF arm]

- Trial results could easily be the reversed if energy density was made higher on the minimally processed diet.
- Evidence suggests reducing energy density can also significantly reduce daily energy intakes.

		Comparator	UPF
Preston (2025)	Total*	1.8	1.8
Hamano (2024)	Total	<mark>1.1</mark>	<mark>1.7</mark>
	Solid	<mark>1.1</mark>	<mark>2.0</mark>
Hall (2019)	Total	1.03	1.02
	Solid	<mark>1.06</mark>	<mark>1.96</mark>
Dicken (2025)	Total*	1.37	1.7

RESEARCH

Open Access

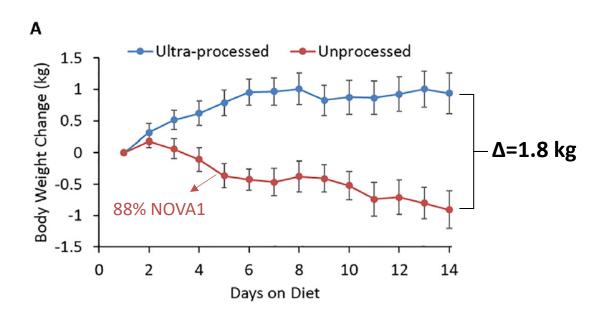

Calorie reformulation: a systematic review and meta-analysis examining the effect of manipulating food energy density on daily energy intake

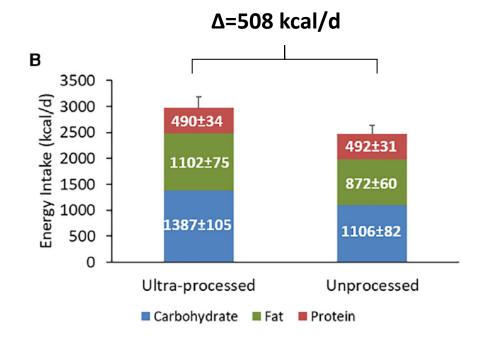

Eric Robinson* , Mercedes Khuttan, India McFarland-Lesser, Zina Patel and Andrew Jones

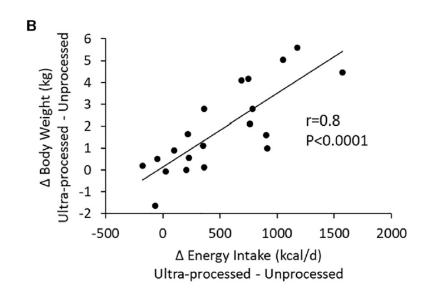

With inputs from Prof. Faidon Magkos (KU), Prof. Eric Robinson (Liverpool).

Do UPF's drive passive "overeating"?

- 20 M+F without obesity, fed *ad libitum* for 2 weeks with UPF or MPF, in a randomized crossover inpatient design (no washout).
- The UPF diet had ~2-fold higher solid food energy density (matched total), and higher proportions of added/total sugars, insoluble/total fiber, and saturated/total fat.

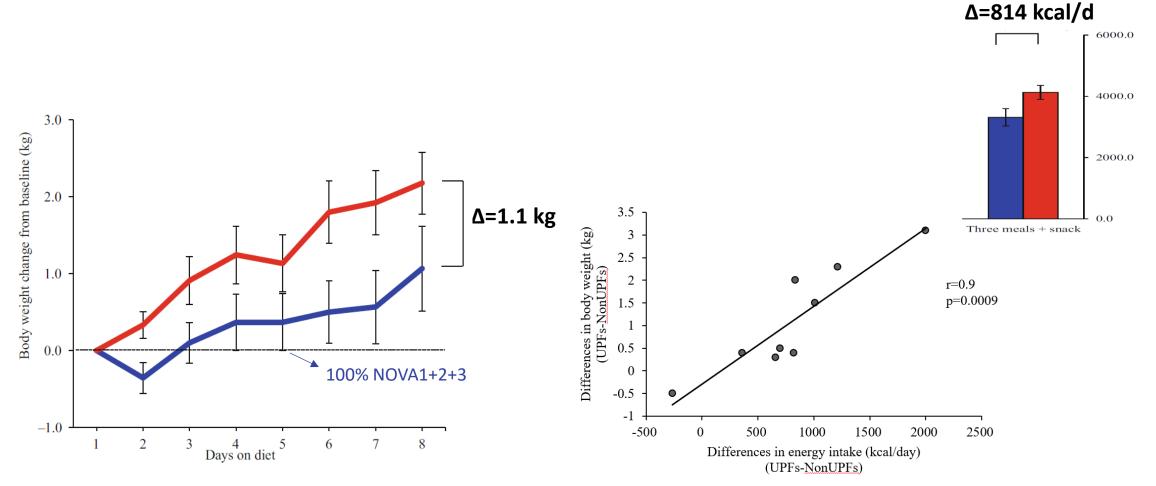

Do UPF's drive passive "overeating"?

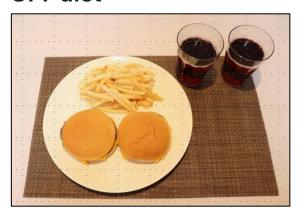

- 9 M with obesity (Asian), fed **ad libitum** for 1 week with UPF or Non-UPF, in a randomized crossover design with 2 weeks washout (inpatient).
- The UPF diet had ~2-fold higher total and solid food energy density, and about half the amount of fiber and 50% more SFA.

Minimal processed diet

UPF diet

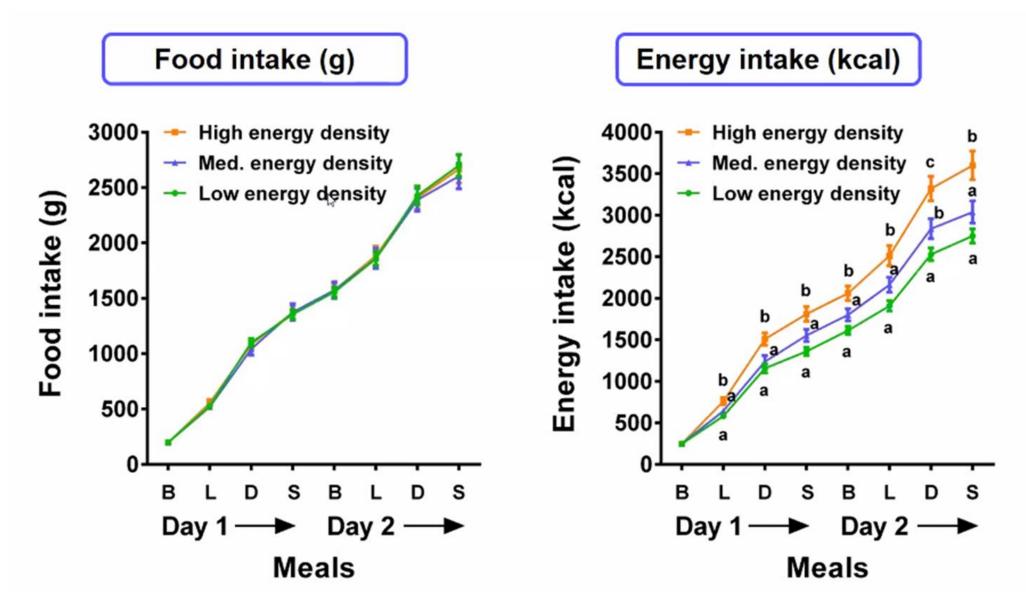

Hamano (2024) *Diabetes Obes Metab* 26(11)5431

The effect of Energy Density on Energy Intake (acute)

Consistent evidence from many controlled studies that meal energy density drives intake

(in adults, children, at breakfast, lunch, dinner, snacks, across different macronutrients...etc)

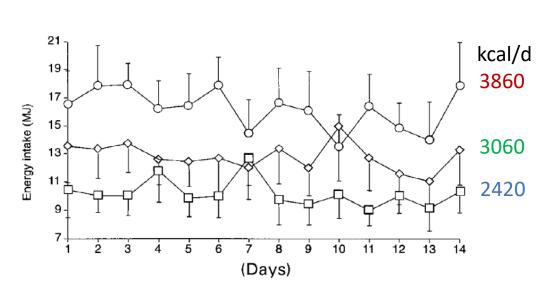

Prof. Barbara Rolls
Penn State

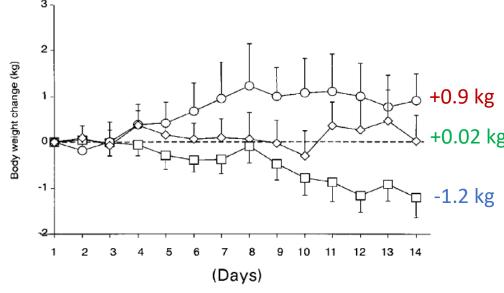

Energy density as a determinant of Energy intake and Weight (2wks)

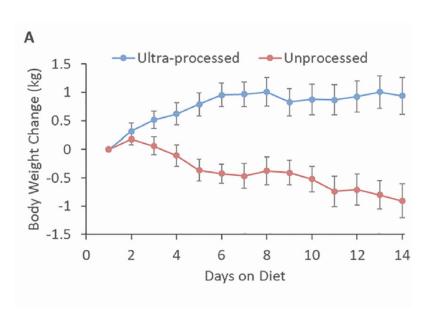

1.06 kcal/g

1.96 kcal/g

• 6 lean M, fed **ad libitum** for 14 days with low (**0.85 kcal/g**), medium (1.3 kcal/g), or high (**1.75 kcal/g**) energy density (**covertly manipulated**), in a randomized crossover design with a 4-day washout (pseudo-inpatient).

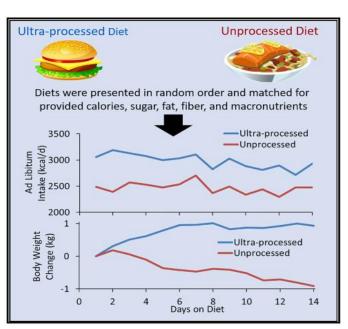

- High energy density (HED)
- Medium energy density (MED)
- Low energy density (LED)

Do UPF's drive passive "overeating"? A role for Eating Rate...

50% higher energy intake rate

 $(\Delta 17 \text{ kcal/min})$

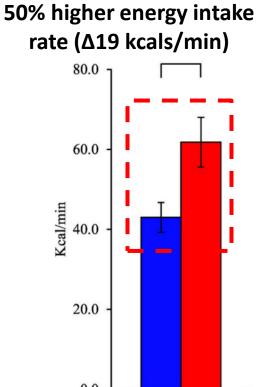

Cell Metabolism Ultra-Processed Diets Cause Excess Calorie Intake and Weight Gain: An Inpatient Randomized Controlled Trial of Ad Libitum Food Intake Ultra-processed Diet Unprocessed Diet Unprocessed Diet A7.7 g / min higher ER for UPF

60 P<0.0001 50 **Eating Rate** P<0.0001 Meal kcal per min grams per min Unprocessed Ultra-processed

RCTs and Eating Rate

- ED and ER always higher on the UPF diet arm.
- Eating rate; an effect moderator for energy density

Ultra-processed diet

Minimal processed diet

Hall et al (2019) Cell Metabolism

Hamano (2024) *Diabetes Obes Metab* 26(11)5431

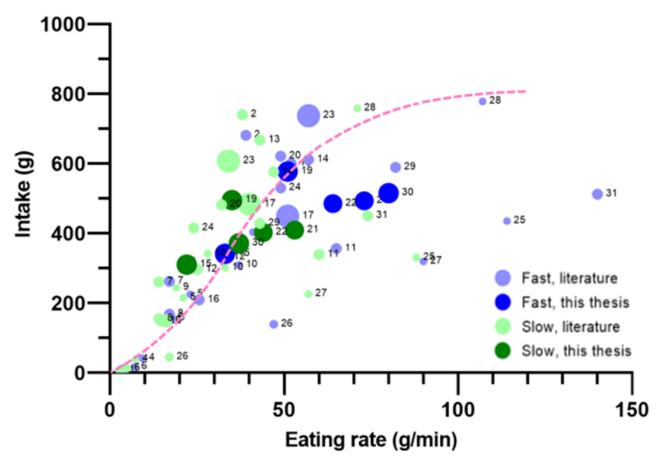

The effect of Eating Rate on Food and Energy Intake

Consistent evidence from acute feeding studies that meal texture moderates eating rate and energy intake

(in adults, children, across meal occasions, prospective birth cohorts, controlled feeding trials, population studies, across age, gender...)

Eating rate (g/min) versus food intake (g) of 24 studies and 182 foods/meals. Data

Robinson et al (2014) American Journal of Clinical Nutrition

Forde et al, 'Food texture influence on eating rate and intake' (unpublished data)

What is the combined effect of Eating Rate and Energy Density on intake?

Cross-over ad libitum controlled feeding trial

N = 69 participants, appetite standardised before each test meal

2 (ED) x 2 (ER) test meals + 1 control lunch meal (medium ED and ER) (~350 meals)

Slower Eating Rate

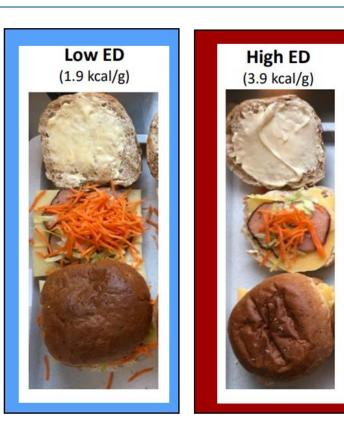

ControlMedium Eating rate

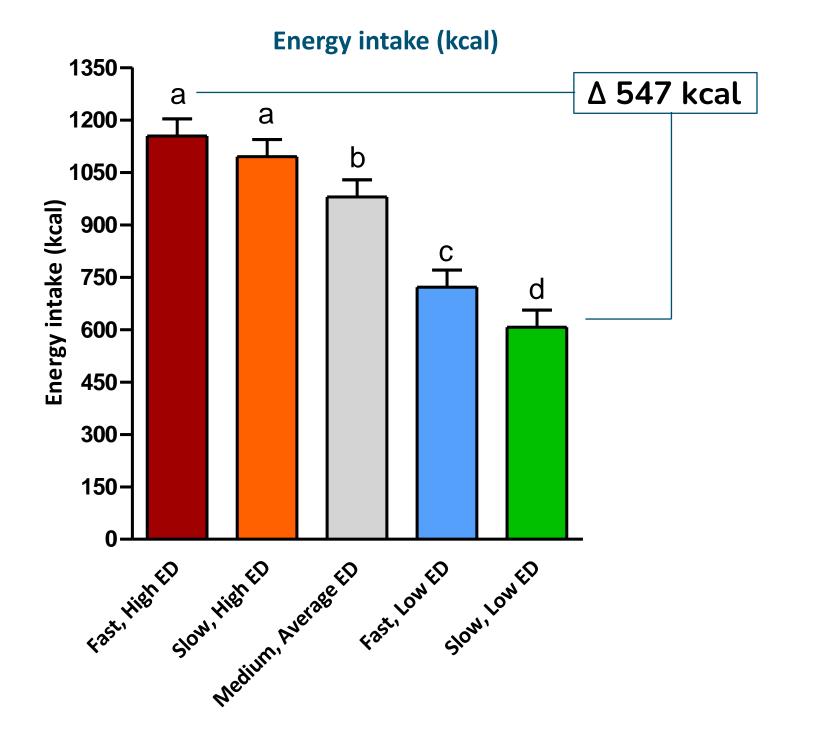

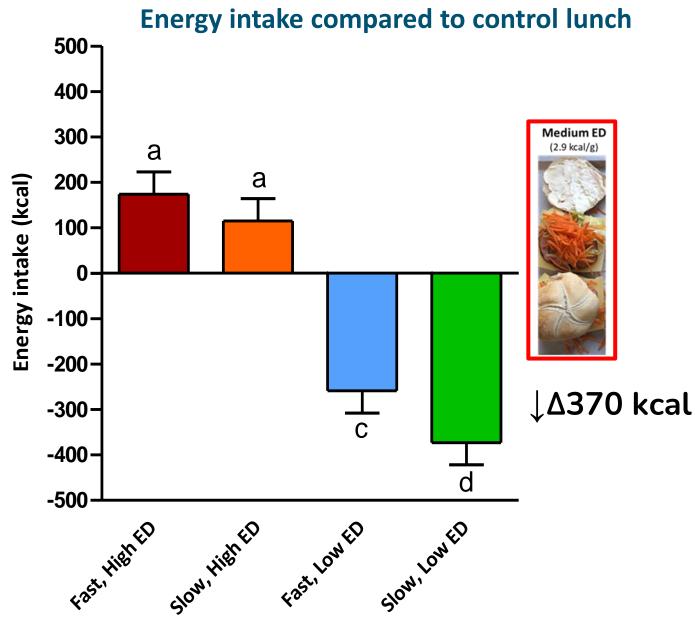

Faster Eating Rate

All Meals were UPF (Nova 4) and all were Matched for liking

What is the combined effect of Eating Rate and Energy Density on intake?

The Restructure Project

Understanding the impact of texture-based differences in eating rate on energy intake from Ultra-Processed Diets

Prof. C. Forde (PI)

A-Prof. M. Lasschuijt

Marieke van Bruinessen (PhD Student)

Prof. M. Stieger

Zhen Liu (PhD Student))

A-Prof. J. Rubert

TKI-Agri-Food (NL) LWV22150; 'RESTRUCTURE'

https://restructureproject.org/

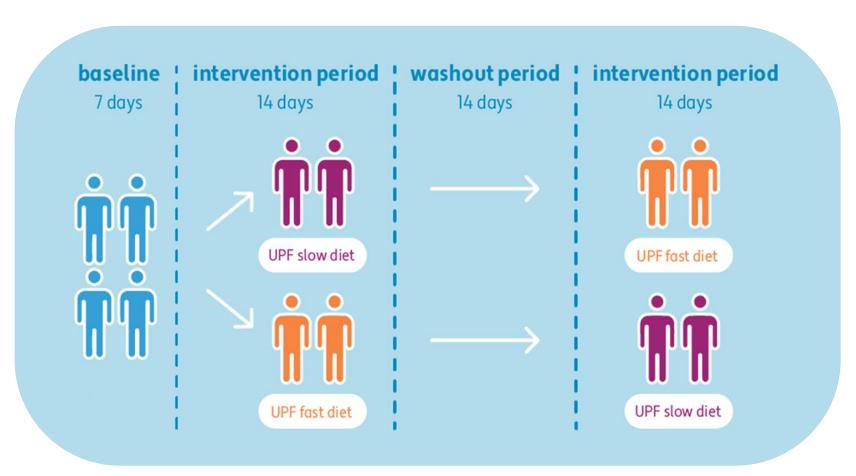

Clinical Trials: NCT06113146

Primary Outcome

To determine the effect of Meal Eating Rate (UPF slow ER vs UPF fast ER) on ad libitum daily energy intake from UPF diets (kcal/day) across a 2-week period.

Secondary Outcomes

Changes in Body composition and metabolic markers of health (i.e., satiety, glucose, gut-microbiome)

>5,000 kg of food served
3,444 meals / 1,142 menu days

Clinical Trials: NCT06113146

Key Difference

Meal textures selected to slow down or increase eating rate

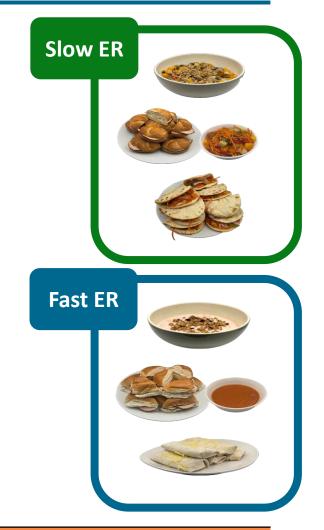

Lasschuijt *et al* (2025) *Nutrition Bulletin* (Protocol) Forde *et al* (2025 – in Press) *AJCN* (RCT outcome)

UPF –Fast vs. Slow Study Diets

Matched on:

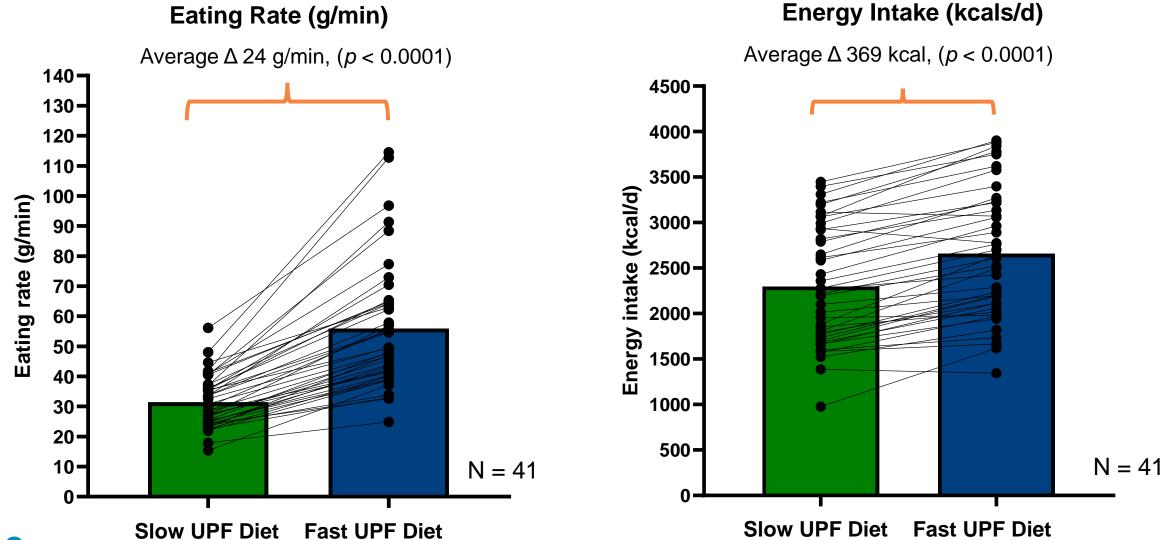

- Ultra-Processed Foods (~ 95 EN% Nova 4)
- Portion size (g; kcal) & Meal volume
- Non-beverage Energy density (kcal/g)
- Variety (i.e., number of components)
- Matched for Palatability & Familiarity
- Diets consumed to fullness on both arms

Daily Menu Averages	UPF Slow-ER	UPF Fast-ER
Amount (g)	3821	3823
Energy (kcal)	5831	5835
Non-beverage Energy density (kcal/g)	1.53	1.53
Ultra-processed foods (EN%)	97	94

Is energy intake from UPF moderated by Meal Texture?

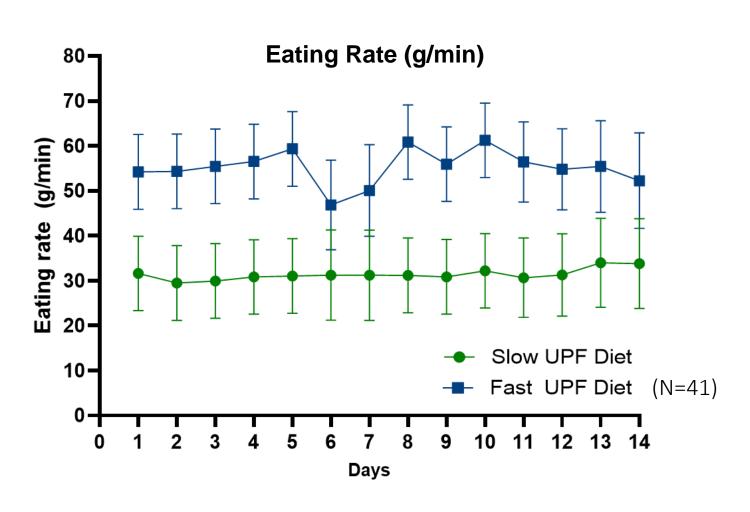

Consistent effect of Meal Texture on Eating Rate and Energy Intake Across All Participants A Slower Eating rate reduced daily energy intake by an average of 369 kcal/d (CI: 221, 517)

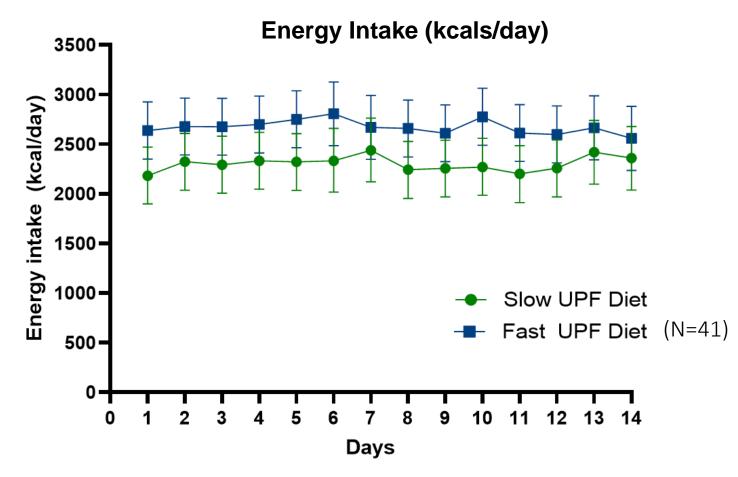

Is the effect of Meal Texture on Energy intake Sustained?

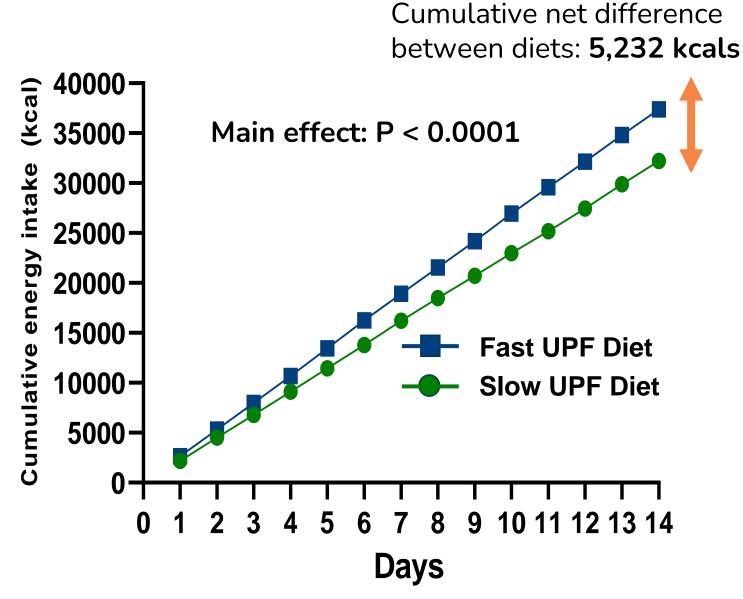

Sustained effect of meal texture on both eating rate and energy intake over 14-days of the diet intervention

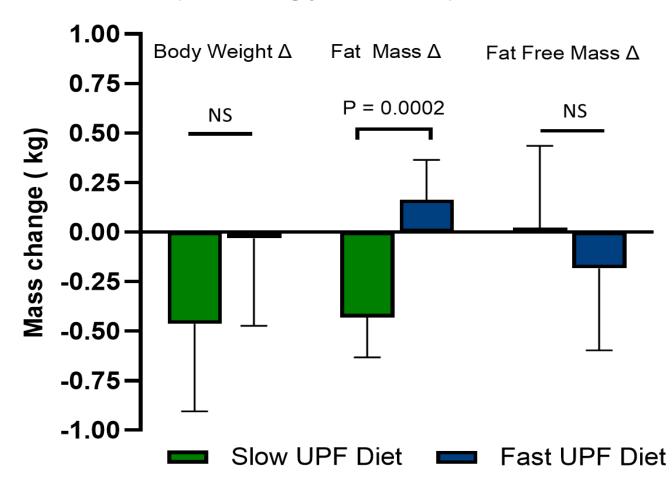

Differences in Cumulative Energy Intake and Fat Mass Between Diets

No sig. differences in body Weight Slower Eating led to reduced fat mass (Δ 0.43 kg p = 0.0002) between diets

Conclusions

Energy Density and Eating Rate

Energy density and Eating rate have an independent and combined effect on energy intake.

Implications for Public Health?

Exchanging UPF's for 'unprocessed foods' may be a 'simple' public health message, but available evidence suggests traditional nutritional quality rather than food processing should remain the cornerstone of dietary guidance.

Implications for Food Producers?

Knowing which sensory and nutritional attribute(s) facilitate overeating can enable food structures/formulations to attenuate these effects (i.e. playing on a foods texture, diluting energy density or increasing protein and fiber).
